Loud and prolonged has been the denunciation of public-houses as the cause of crime and misery—so easy is it to mistake secondary for primary causes. While admitting that public-houses scattered in profusion are the cause of many evils, we go a little farther, and looking for what produces the cause, find that it consists in depraved tastes, want of self-respect, unthrift. To a man of elevated tendencies and intelligent foresight, the number of public-houses is a matter of no importance. He passes by the whole with indifference. Their allurements only excite his pity. He scorns their temptations. It is to this pitch of fortitude we should like to see the weak-minded brought, through education and the habitual cultivation of self-respect, along with a deep consciousness of responsibilities. In therefore so exclusively attacking public-houses as the cause of intemperance, we are in a sense beginning the process of cure at the wrong end. We are expending energies on secondary causes, leaving the seat of the disease untouched. Under infatuations of this kind, the misdirection of moral power is pitiable. The subject is wide, and might be expatiated on to any extent. We here confine ourselves to the remark, that the thing to cultivate is Thrift—not only as regards the expenditure of money but expenditure of time, and in saying this we fear that those who have systematically, though with good intentions, advocated a degree of recreation that must be deemed excessive and dangerous, have not a little to answer for in promoting habits of unthrift.

W. C.

FROM DAWN TO SUNSET.

PART II.

CHAPTER THE ELEVENTH.

It was about this time, or some three or four days after Kingston's arrival, that Mistress Dinnage was sitting—languidly for her—at the door of the lodge. Mistress Dinnage lived a life of constant energy; she did not sit and lament; she had her sorrows; but they were closed within the proudest heart that ever beat, and no man knew of them. But all the more dangerous is the stern sorrow that feeds upon itself, the aching, ever-present grief, so stoically disregarded. Mistress Dinnage indulged in neither tears nor regrets; bravely she did her duty day by day, and never would sit down to court a sweet and fancied dream. But when evening came, what had she to do? Father was not home; the tall clock in the corner went

tick, tick, tick! Lady Deb was busied with her kinsman Kingston Fleming; old Marjory was no companion to Mistress Dinnage. Lives are so different. In some more genial lives, in some gay changeful or adventurous life, sorrow and despair are kept at bay. In contrast to this life of Margaret's, there was May Warriston far away, dreaming through courtly galleries, gazing on splendid pictures, listening to ravishing music, kneeling before gorgeous shrines. Amid such scenes as these, the heart-strings may be tuned to never a discordant note. But in eternal calm, in depressing sickness, in dreary hours of solitude, then the grim spectre looks on us face to face. We may work; ay, but when we pause to rest? Work, everlasting work, gives a stern sense of satisfaction and the comfort of 'something done;' but unlightened by sweeter moments, neither softens the heart nor strengthens the mind. Under that stern government, imagination sleeps, thought grows torpid, the poor wounded soul is grasped within the iron hand it defies, Nature herself lies bruised and bleeding.

In the hours of hard work and daylight, sorrow was to Margaret Dinnage unheeded, unheard, uncared for; but when forced inaction came, when the little room darkened slowly, and the lightest whisper of the breeze began to be heard above the hushed tumult of the world, then the tall clock told a monotonous tale moment by moment to the proud still heart—a tale of solitude and hopeless calm. She would go to the porch not to hear it; but to go out and roam about the happy fields she could not, for there she had played when a child. No; better stand at the door and watch; father would be coming soon.

One evening as Mistress Dinnage thus watched, the gate swung to; not the stooping form of old Jordan Dinnage, but a tall and tower-like figure loomed through the gloaming and darkened the doorway. Loud and full beat the heart of Mistress Dinnage; she could not speak. For the first time for years, she and Charles Fleming were alone.

'Who is at Enderby?' he asked, in a short stern voice.

'Mistress Deborah,' she answered, with hurried breathless utterance, 'an' Master Kingston Fleming.'

'Not my father?'

'No.'

'Has Master Sinclair been here lately?'

'Yes; he was over yesterday morning.'

Then the gloaming parted as it were to admit of a blink of sunshine, and the dark eyes that were gazing up sought the haggard eyes that were gazing down upon them, and all in a flash. 'Twilight and the wild sweet solitude around them drew those proud hearts together with a power that yearning nature could not resist. The spell of Love was woven around them. Not one word was uttered: stern silence, weary endless longing, pride, grief, trouble, despair, all were now hushed in one long embrace. Long and wordless as had been

estrangement, so swift and wordless the wooing; no syllable was needed to tell what the soul had known.

What mattered it in that supreme moment that he was a hunted ruined fugitive—that she was a poor and penniless girl—that they met but to part again? The sweet summer breeze was blowing round them; the trees trembled with gladness overhead; they were young; the world was wide and free. The solemn warning voice of the old clock, for them spoke in vain.

When Mistress Dinnage could speak, she whispered on his breast: 'Thou'rt in trouble.'

'In trouble? Yes.' Then, with a reckless laugh, he took her face between his hands, and answered by wild and passionate kisses.

'Nay; thou must speak,' she went on earnestly, and holding back his head with her little hands.

'Kisses will not aid thee, or I would kiss thee till I died. Speak, Master Fleming! Art thou ruined?'

'Ay; stick and stone.'

'I saw it in thy face, only now the love-light covers it. Oh, how canst thou look so glad for my poor love, when thou'rt ruined and disgraced? Bethink thee, Master Fleming. Thine old home will go to strangers. Thy sister will share in thy disgrace. Thy father will go in sorrow to the grave. Thou'rt ruined, disgraced, dishonoured!'

He caught her to his heart, and then held her wildly from him, regarding her with infinite pathos. 'And wilt thou throw me over, Meg?'

Then spoke she anxiously: 'What is it thou mean'st? Speak out to me. Let there be no secrets and no riddling. Dost thou love me truly?'

Then answered the proud liquid glance of those dark eyes; and whispered the youth low in her ear: 'I would like to kill thee for this questioning! Truly, love? Dost thou know Charles Fleming so little, that thou'rt in doubt? that thou canst believe he could wrong the only girl he ever loved? Ruffian, gamester, roysterer though I be, I would keep thee pure as snow—snowdrift. Thou shalt make me a better man, who knows? For thy love I thirst, Meg, and have thirsted long. Now—ruined, an outcast, a fugitive, is the moment I choose to seek thee! Wilt have me, Meg, for better, for worse? Wilt share the fortunes of a sinner? Perilous, comfortless, will be thy lot, love. Wilt thou be my wife?'

She could not speak; she answered by a low cry of love and joy. What recked Mistress Dinnage of the proud grand home and the heir of the Flemings, all passed away! She loved—with all the pure abandonment of a woman's love this houseless wanderer.

So came Charlie Fleming, and went, and haunted in the twilight round Enderby, and no one knew of it save Mistress Dinnage. She was put about, dismayed, torn by anxiety by all she heard; and the two loves of her life, the loves of father and lover, were wrestling wildly in her soul. Though fearing for her lover, yet, strange inconsistency, her step was light as air, her heart was filled with a new joy, and her eyes with happy tears.

'I must go,' thought Kingston Fleming desperately to himself, the morning after the above

scene. 'The old fellow won't turn up, neither does Charlie. I mustn't compromise her. But she must not be alone. I doubt—I doubt sorely about the future. Poor sweet child! I will speak to old Marjory; she must hold that flighty Mistress Dinnage in the house. And I will get Deb to send for May Warriston.' So thinking, Kingston went into the garden, where he saw Deborah at her flowers, and abruptly he began: 'I am come to say farewell, Deb. Don't look scared, little coz; you shall not be left alone.'

'Then whom shall I have, King?' she asked, clinging suddenly to his arm. 'Father is away; Charlie is away; and I am in hourly fear of evil tidings. You say, *not alone!* O King, I shall be alone indeed!'

'Little one, I am going to write to May Warriston, to beg her to come and bear you company. Meantime, I am going to see your father. I know his whereabouts, love; I will send him home to-night. And have ye not Marjory, Jordan, and your beloved Mistress Dinnage?'

'Ay, I have them all. But what are weak women and a poor old man compared to your size and strength? With you, King, I am safe. In your presence I can be thoughtless and glad again. In your presence—I am happy.'

'O Deb, Deb! Don't persuade me. I mustn't stay with you. Ill tongues will be talking of you and me.'

'What! of brother and sister? Of kinsfolk? It cannot, cannot be. But let the world talk! What matters it? Will you, for paltry slander, forsake me at this strait?'

'Not forsake you, but consider you. Let go my hand, Deb! I am easily unmaimed nowadays. I must go.'

'Well, go, go!'—and she pushed him from her. 'And indeed I would have you seek my father, King, for I am very sad at heart. Cheer him up; comfort him; wean him from his temptation if you can. It is that terrible gambling that is the ruin of the Flemings. Oh, tell him so! But above all things, send him home, for I have a dark, dark foreboding on me; and this night alone at Enderby would drive me mad.'

'He shall come.'

'Then go, King, quickly.'

'You are in a hurry to be rid o' me, now. Good-bye, sweet Deb; good-bye. You will not come and see me off?'

'Nay; I cannot.'

'Well, good-bye, Enderby.' Kingston Fleming bared his head and gazed round, strangely moved, at the old familiar scene. His keen blue eyes grew dim. It did not shame his manhood that tears were drawn like life-blood from his heart, as he nobly renounced a sore temptation. 'Good-bye, Enderby; good-bye.'

He was gone. But still Deborah Fleming, amid her gay and dazzling flowers, seemed to see him standing there, a tall graceful figure, a face full of sadness and regret, a bared head that reverently bowed its adieus; and the words still rang in her ears: 'Good-bye, Enderby; good-bye.' Ten short minutes and all life had changed for her; only when he was gone, she waked to her despair. The sun had ceased to shine, the birds had ceased to sing, the flowers to bloom. She left her gathered flowers to die, and went home like one stunned.

CHAPTER THE TWELFTH.

Sir Vincent did return that night; he had seen Kingston, he said. He was very late, and he was tired. He asked Deborah if Mistress Dinnage were with her.

'Yes, dear father. But you are going to sleep at home!'

'Ay; but I may be off early—too early for even thee, my bird of dawn.'

'Nay, father; I will be up, not to see thee off, but to hold thee here. Thou shalt not go to-morrow!'

He smiled. He looked pale. He kissed her fondly.

'Lady Wilful, I must. I want to see my boy. He is ever in trouble.'

'Nay; think not about it to-night, father. King has promised to find him out.'

And so they parted. Weary-hearted, with all the brightness called up for her father laid aside, Deborah sought her chamber, weeping. She recalled, the night when her father had told her Kingston Fleming was betrothed, her wild despair. But she was a child, and the bright morning had then brought hope and healing. Now she was a woman, and a woman's sorrow lay deep within her breast. Tired out, Deborah undressed and lay down on her bed, not to wake and weep, but to sink into a deep dreamless slumber. . . .

With a start she awoke. A start often wakes us from the soundest sleep, as if some spirit spoke. Deborah Fleming was so wide awake in a moment that she saw through her open window the little pale ghost of the waning moon, the drifting clouds flitting by. A strange feeling was on Deborah. Had she been dreaming that she had seen a light shining under her father's door? Dream or vision, she seemed to see it still, and was irresistibly drawn thither by a mysterious inner sense of alarm. She must go to her father's room, to see that all was well. With a wildly beating heart, she threw on her dressing-gown and went swiftly out. Gray dawn filled all the passages, a gray cold dawn, and the little birds were beginning to twitter. But yes—oh, strange and true, a light was glimmering under her father's door!

Deborah heard him moving; she knocked. 'Father!'—No answer.—'Father!'

'Who is there?'

'Deborah! Father, open your door; I must speak with you at once.'

She tried the door: it gave way; and Deborah saw a room scattered over with papers, in the wildest confusion. The window stood open, and Sir Vincent, looking gray and haggard in the uncertain light, stood against the table in the middle of the room. He was dressed; his long white hair was ruffled; his face was gray, pale; his eyes gleamed strangely on Deborah from under their lowering brows.

'Father!' said Deborah, 'my father!' A great trembling was on her, he looked at her so strangely; but she kept outwardly calm. She laid her hands upon his arm, and then her eyes fell from his troubled face to his trembling hand, which was striving vainly to hide something amongst the papers on the table. Deborah saw the handle of a pistol; she drew it out, and regarded him steadfastly. 'Father, father! what is this?'

He turned from her; his white head was bowed with shame in his hands, and she heard a bitter sob.

'I know it now,' said Deborah, with terrible calmness. 'God called me here. O dear father, what have you thought on? To get free of ruin, you would kill your soul. Kind heaven have mercy on thee! You would leave me, father; you would leave me and Charlie.' She flung the pistol out of the room; she threw her arms round him. Sobs were shaking the strong man's frame.

'O never think to leave me alone, father dear. It was sinful of you not to call me; you might have known your little daughter would sooner share your death, than wake to find you dead.'

'God forgive me, Deb; God forgive me; and he sank into his chair faint, trembling, shuddering. Deborah, on her knees beside him, scarcely knew her proud father, he was so unmanned. She waited in silence, with her head laid down on his knee. When he could speak, he said: 'I see God's hand in this; I believe in Him as I never believed before. Child! nothing less than a miracle brought thee here, as heaven is my witness; in another moment, Deb, I should have been a dead man. I had the pistol in my hand; may He forgive me, Deb!'

Then Deborah looked up white and calm; 'What could have induced you, father? What ruin could be great enough to justify so great a sin? The loss of house and lands? Let them go. You and I had better live in some poor honest way, than keep at Enderby. Let it go. It is no great matter, so long as you have your children's love.'

He groaned. 'It isn't all, Deb; ruin isn't all. We have that, and enow. But ye know the old saying, "Death before dishonour."—Charlie, Charlie!' and the father's tremulous lips struggled piteously to utter more.

'Has Charlie disgraced us then? How, father?'

'God forbid that I tell thee how. My boy has killed me.'

'Will money save him, father?' The stern low voice scarcely seemed Deborah Fleming's.

'Money, ay; but we are beggars.'

Deborah started to her feet. 'Well, think of it no more; you are wearied to death, my father. Thinking won't right you nor save Charlie. Sleep in peace, father, for I will save ye both this day.'

He stared in her face. 'Heaven bless thee, Deb. I know not what thou say'st. I think my brain is shaken, Deb. But thou'rt my only stay.' With that, the heart-broken old man, fallen so lowly from his high estate, lay down, and fell into a deep sleep. Not so Deborah.

Late in the morning, Sir Vincent awaked, and called for his daughter. It seemed that she was near, for he had scarcely called before she stood beside his bed. His strength was recruited; the strong and nervous spirit had regained its power, and lived again in torture. He gazed up at Deborah, piteous in his grim sorrow; still, in all his strength, he turned to her: 'Deborah, my child, what is to be done?'

'I am decided, father. I will be Adam Sinclair's wife. He has money enough to buy Enderby. Look you, you have nothing more to say; only see that he knows he may marry me.'

'Thou'lt marry Adam Sinclair! Deb, art in earnest? Can ye do this? But does it vex ye, love? Does it grieve ye too much?'

She looked so calm, he could not believe this sacrifice, but half believed her indifferent; he was sorely trembling.

'Nay, father. How vexed? how grieved? Ask me no questions. You know, father, I was always "Lady Wilful," and very firm. Here now is a note writ by mine own hand to him. I am decided.'

Sir Vincent rose up; he knew not if he were most glad or grieved or scared, as he took her in his arms and blessed her. Never had Deborah received love or blessing so passively. She put the note in his hands, and looking at him with her great gray earnest eyes: 'Sweet father,' she said, 'it must needs be soon; and that he may know that I am in earnest, I have left that "soon" to him. I am sincere with him, father, and I tell him I have no love to give; but I would fain save Enderby; and so I ask him if he will save Enderby for love of me, and yet leave me free. There is a loophole, father, for I have no wish to wed. But if he must wed Deborah Fleming, and only this will move him, I am ready. But as he will choose the wedding-day, I stipulate for freedom till that day, never to write nor meet till the bells ring for the wedding. Let me be Deborah Fleming till then, and forget Adam Sinclair! Lovers and wooing I cannot abide. And life is long enow from the wedding to the grave!'

Sir Vincent stood with the letter in his hand. 'Deborah, ye speak strangely; yet you are smiling, and your eyes and cheeks are bright. Little one, tell thy wretched father if thou'rt unhappy over this? Speak, Del, darling; and if it grieves thee, I will see myself in jail, and Charlie on the gallows, ere thou shalt sacrifice thy life. Deborah, be honest with me.'

'Why, I am honest always. It will not hurt me. I will be a good wife to him till the day I die, if it must needs be so. But would you have me say I love him, reverence him? This cannot be. But if he will not save Enderby otherwise, I will be his wife. Of the rest—I will not ask you—I dare not. But Charlie shall be saved.'

At these words Sir Vincent fell on his knees, and kissed his child's dress like one beside himself, and then pale and wordless, rushed away. . . . Then Deborah was left alone. The gay sun was shining in, and the birds were singing from far and near; away up, Deborah's pet bird the skylark was pouring out his supreme song of freedom in the blue fields of space. She heard the trilling cadence from the wild bird's throat. It drew her to the window, where she leaned out, and drank in those delirious strains of joy, and stretched out her arms to the blue sky, and thought of the little nest where the bird would drop, when tired with wandering and with song. Could she be Deborah Fleming? Would the messenger now speeding to Lincoln Castle bring her back freedom, or death in life? She must wait, she must wait! Meantime, the o'ercome was ringing in her ears of an old song that Kingston Fleming whistled when a boy, and the sweet warm sun was shining on her, and Deborah laid her aching head and her arms down on the window-sill and fell fast asleep. It was then that Mistress Dinnage stole in; her face too was pale and grave, but not so pale as the sleeping one over which she leaned. With her hands clasped, she stood regarding it till her lips quivered, and tears of troubled anxiety

started to her eyes. 'Ay,' she said with stern tenderness, 'you will die for him yet; but I would die for him and you.' Then softly and in tender care, young Mistress Dinnage passed a soft cushion under the little head, and laid a light shawl over Deborah to shield her from the sun, and stole away.

MARKET-GARDEN WOMEN.

WHILE the fruit-harvest is in progress, travellers through the western outskirts of London will doubtless have noticed the numerous gangs of women employed in gathering and packing fruit and vegetables for market; the railway in that district running for several miles through market-gardens and orchards. The peculiar dress of these women—consisting of a large calico sun-bonnet, brightly coloured neckerchief, short skirts reaching scarcely below the knee, and large holland aprons—is alone sufficient to attract attention, even in the momentary glimpse one obtains of them as the train sweeps past. Daily, in sunshine and rain, these women are busy collecting the fruit and vegetables which are nightly conveyed to the London markets; and as some knowledge of their manner of life and the amount of their earnings may prove interesting, we offer to our readers the substance of a conversation held with a member of one of the gangs during the earlier part of the season.

'Do we get pretty good wages? Well, you see, sir, it all depends on the season. Just now, when strawberries are in and peas, we can earn as much as thirty shillings a week—some weeks more. Raspberries and beans we do pretty well with, but gooseberries and currants ain't so good; eight-and-twenty shillings a week is as much as we can make at those, working hard and long for that. Of course we have to work long hours, beginning at four or five o'clock in the morning, and keeping at it till eight and sometimes later at night, generally taking about an hour's rest at dinner-time. But as we gather all the fruit by piece-work, and so to speak, our time is our own, what dinner-time we take depends on what sort of a morning's work we've made—sometimes longer and sometimes shorter. You see, this is how we work. In my gang there's six of us, that have always worked together for a good many years now. We get one on each side of a row of strawberries or raspberries or peas, or what not; and when one basket is full, we puts a few handfuls in our apron, always managing so as to take in all the baskets full together; and then at night, when our work is counted up, we share it equally amongst us. We always know every night how much we have made, but only get paid once a week, on Saturdays: Saturday, you know, being an easy day with us, on account of there being no market on Sunday. Our missis is very good that way; every Saturday, afore twelve o'clock, there is our money, much or little; though there is some of the masters as think nothing of keeping their women waiting about till six or seven o'clock at night before they pay them, and perhaps then only gives 'em a part of it; which comes hard on folks as live from hand to mouth, as we have to do; the shop at which we deal only giving one week's credit—pay up one Saturday night, and run on as much as you like till the next; or if you don't pay up, no more credit till you does.'

'Apples and pears and such-like fruit we have nothing to do with—men gather *them* in. In fact as often as not the master sells the fruit as it stands on the tree, and the buyer has to get his own men to pluck it. But there's always some sort of fruit or vegetables to be gathered from the beginning of spring till the end of summer as we can do by piecework; and then the potatoes come in, which we pick up after they've been turned out of the ground by men or by a machine; but that we does by day-work, getting one-and-sixpence a day when we work from six to six; and one-and-twopence when we work from eight till dark. In winter-time there's always something to be done dibbing in cabbage-plants, weeding, and such-like; but what with sharp frosts and heavy snows, we don't earn much then, perhaps doing three or four days' work in a week. Of course if we haven't had the sense to put by some of the money we make in the good times of summer, times come cruel hard on us in the winter; and very few of us like to apply to the parish if we can anyhow help it. Not but what our missis is good to us in that way, often finding us a day's work when it ain't needed, and always giving us a half-pint of beer at the end of the day; which we can't claim, you know.

'We don't take much count of rain either winter or summer, because, you see, people will have their fruit and vegetables fresh gathered; and so we wrap ourselves well up and make the best of it. As I said before, Saturday we don't do much; but then we have to make up for it on Sundays, so as to send the fruit fresh to Monday's market.

'Don't we suffer from rheumatics? Well, you mightn't think so, but it ain't often any of us ails much. You see, being out in all weathers, we get hardened to it; and besides, we always take good care to keep our feet warm and dry—that's why we wear such heavy boots; and that's the chief thing to look after, if you don't want to catch cold; so people say. There ain't many of us but what is on the wrong side of thirty; four out of *my* gang being widows this many a year, with grown-up sons and daughters; and it's the same in most gangs. Sometimes we have young women amongst us; but there's not many of 'em stays at it after they are married; not all the year through, I mean; perhaps coming for a day or two at the busiest times; but even then it hardly pays them, if they have a young family about 'em. The gangs of young women as you sometimes see, we don't count as belonging to us; they only coming up from Shropshire mostly—for a month or six weeks at the busiest part of the season. Children we never have working with us, I suppose because they wouldn't be careful enough about not crushing the fruit; which as *you* know, it would never pay to send crushed fruit into market. For my part, I'm very glad as there is no children allowed amongst us, as though it ain't very hard work, it's terribly tedious and back-aching. When our children is old enough, we send the girls out to service somewhere; and there's always plenty of work for the lads, of some sort, about the farms; which is a good deal better than breaking their backs at our work.

'We all of us in my gang live hereabouts, in those little cottages that you see yonder. Three shillings a week the rent of 'em is; but then there's a good piece of garden-ground at the back; and most of us has lodgers, young men what work

on the farms and in the gardens mostly. Four rooms there is in my cottage; and I have three lodgers, sometimes four, two sleeping in one room. Good lads they are too. You see, as they get home before I do, I always lay my fire in the morning before I go out; and a neighbour of mine sets it alight in time for the kettle to be a-boiling when they come in to their tea at six o'clock; and they never misses leaving a potful of good strong tea for me to have when I get home; which you may be sure is all the more grateful through being the only hot drink I get all day, having only a drop of cold tea, which I carry in that can there, for my breakfast. And maybe if we are working near a public-house, we club up, and one of us goes and gets a drop of beer to drink with our dinners.

'If it wasn't for the lodgers, the gardens wouldn't be much use to us; but they generally take it in hand, and often comes to take a pride in it; so that we are never short of such vegetables as are in season; which helps a good way towards the rent. They also chop up my wood and fetch my water for me, and make themselves handy in a score of ways; indeed if I lost my lodgers, I don't know what I should do. It ain't much cooking I do in the week; but what there is to do I do after I come home. On Sunday the lads always look for a hot dinner; which when I'm at home, I cook for them; and when I'm at work I get all ready on Saturday night, and one of 'em takes it to the bakehouse to be baked. When we do work on Sundays, if we anyhow can manage it, we try to get done by three or four o'clock, so as we may be in time to dress and go to church; which as a rule we mostly do.

'I can't read nor yet write, and I don't suppose as there's a-many amongst the oldest of us as can. It wasn't much chance of schooling girls like us got in my time, as we was sent out to work at something or other when we was about nine or ten. I did go to school for a little while; but if I learnt anything I must have forgotten it again. The young ones are better off for the matter of that, and are always willing to read or write a letter for us when we want 'em.

'Nineteen years I've been at it regular now, sir; and though I was left a widow with seven children, the oldest of 'em only ten and one at the breast, I'm proud and thankful to say as we've never had any need to ask once for a loaf of bread even from the parish, and trust as we never shall. I ain't the only one either, for there's Mrs Amblin as lives next door to me was left with nine children, oldest only twelve, and has lived to see 'em all doing for themselves without being beholden to nobody for a crust of bread. Some years, when the fruit has been backward or scarce, we've had a very close push to make ends meet; but it has only taught us to be more careful when we have a good season, and to put by a little more towards a bad one. We don't use any bank, bless you! what little we can manage to put by, we generally likes to have handy where we can put our hand on it when we want it. Of course, there's no telling what may happen; but while I have my health and strength left me, I shall always be able to earn as much as I need; and if it should happen as *they* fail me, well, what with lodgers and the shilling or two my children will help me with, I dare say I shall struggle along somehow. Mostly, though our children don't come to be much more than field-

hands and farm-labourers, when the time comes they don't begrudge what is due to their parents, and manage somehow to keep 'em out of the work-house. Not but some of 'em goes to the bad, as might be expected, seeing the little schooling we can afford to give them, and the temptations there is for them nowadays; but it is only here and there one, and they generally finish up by listing for a soldier, which soon steadies 'em. One of my lads is away now in the East Indies; and though I don't often hear from him, he seems to be getting on quite as well as ever he'd ha' done at home. Our girls mostly gets acquainted with one or other of the men working about the place where they are at service, and get married, sooner perhaps than what we old folks think they ought to—about nineteen or twenty—and settle down near where their husbands work.

'We don't get much chance of holidays when once the season begins, until it is over; because, you see, sir, the master must keep the market supplied; and if he finds one of us not to be depended on to do our work every day, he very soon gets somebody in her place that is; which perhaps is one reason why young women never care to settle down to our life. Altogether, our work ain't so very hard; and if we do have to keep at it for a many hours at a stretch, it's all in the open air, which is a good deal better than being shut up in the walls of a factory; and if we are anyways steady and careful, we can always make sure of a pretty good living. So that you see, sir, there's many as is worse off than us poor garden-women.'

SEA-SPOIL.

SOMEWHAT more than a year ago, we called attention to the changes which are to be perceived in the relations of land and water; the action of rivers on the land, and the influence of delta-lands in restoring land, to the earth, being noted in the article alluded to; whilst the destructive action of the sea on many points of the coast was also detailed. In the present instance we purpose to examine a few of the more typical cases of sea-action viewed in its destructive effect upon the land, and also some aspects of earth-movements which undoubtedly favour the destructive power of the ocean.

As regards these destructive powers, much depends of course on the nature of the rock-formations which lie next the sea. A hard formation will, *ceteris paribus*, resist the attack of the waves to a greater extent than a deposit of soft nature; and the varying nature of the coast-lines of a country determines to a very great extent the regularity or irregularity of the sea's action. A well-known example of a case in which the ocean has acquired over the land an immense advantage in respect of the softness of the formations which favoured its inroad, is found on the Kentish coast. Visitors to Margate and Ramsgate, or voyagers around the south-east corner of our island, know the ancient church of Reculver—or the 'Reculvers' as it is now named—as a familiar landmark. Its two weather-beaten towers and the dismantled edifice are the best known objects amongst the views of the Kentish coast; and to both geologist and antiquary the 'Reculvers' present an object of engrossing interest.

In the reign of Henry VIII. the church was one mile distant from the sea; and even in 1781 a very considerable space of ground intervened between the church and the coast-line—so considerable indeed, that several houses and a churchyard of tolerable size existed thereupon. In 1834 the sea had made such progress in the work of spoliation, that the intervening ground had disappeared, and the 'Reculvers' appeared to exist on the verge at once of the cliff and of destruction. An artificial breakwater has, however, saved the structure; but the sacred edifice has been dismantled, and its towers used as marine watch-houses. The surrounding strata are of singularly soft nature, and hence the rapidity with which the eroding action of the waves has proceeded.

An equally instructive case of the destructive action of the sea is afforded by the history of the parish of Eccles in the county of Norfolk. Prior to the accession of James VI. to the English crown the parish was a fairly populous one. At that date, however, the inhabitants petitioned the king for a reduction of taxes, basing their request on the ground that more than three hundred acres of their land had been swept away by the sea. The king's reply was short but characteristic. He dismissed the petition with the remark, that the people of Eccles should be thankful that the sea had been so merciful. Since the time of the niggardly sovereign just mentioned, Eccles has not been spared by the sea. Acres upon acres have been swallowed up by the insatiable waves, and as Sir Charles Lyell informs us, hills of blown sand—forming the characteristic *sand-dunes* of the geologist—occupy the place where the houses of King James's petitioners were situated. The spire of the parish church, in one drawing, is indeed depicted as projecting from amongst the surrounding sand-dunes, which the wind, as if in league with the ocean, has blown in upon this luckless coast.

The comparison of old maps of counties bordering on the sea with modern charts, affords a striking and clear idea of the rate and extent of this work of destruction. No better illustration can be cited of the ravages of the ocean than that exhibited in maps of the Yorkshire coast-lines, and particularly in the district lying between Flamborough Head and the mouth of the Humber. Whilst the district between the Wash in Lincolnshire and the estuary of the Thames shews an equally great amount of destructive change. Three feet per annum is said to be no uncommon rate for soft strata in these localities to be carried away; and the geologist may point to the famous Goodwin Sands—notorious alike in ancient and modern history—as another example of the results of sea-action, and of the wear and tear exercised by the mighty deep. The contemplation of such actions fits us in a singularly apt manner for the realisation of the full force and meaning of the Laureate's words:

There rolls the deep where grew the tree.
O Earth, what changes hast thou seen!

It is highly important, however, to note that the sea receives aid of no ordinary kind in its acts of spoliation by the operation of certain forces affecting the land itself. Land frequently disappears from sight beneath the surface of the sea by a process of subsidence or sinking. We must

therefore clearly distinguish between the land which the sea literally takes by its own act, and that which becomes its property through this curious subsidence and sinking of the earth's crust. No doubt the result is practically the same in each case; the sea being in either instance the gainer, and the land the loser. But the sinking of land being a phenomenon less familiar to the ordinary reader, we venture to note a few of its more prominent aspects.

A primary consideration to which it is needful to direct attention consists in the due appreciation of the fact that the land and not the sea is to be here credited with the action under discussion. When a considerable part of a coast-line formerly existing above tide-marks is found to gradually sink below the sea-level, the observer is probably apt to assume that the sea has simply altered its level. The idea of the sea being a constantly changing body is so widely entertained, and that of the land being a solid and immovable portion of the constitution of the earth; is also so deeply rooted in the popular mind, that it may take some little thinking to throw on the land the burden of the change and alteration. It is nevertheless a fact that the great body of water we name the ocean in reality obeys the laws we see exemplified in the disposition of the water contained in a cup or bowl. The water of the sea thus maintains the same level, and is no more subject to violent and permanent alterations than is the water in the cup or bowl. Hence when part of a coast-line appears to become submerged, we must credit the land with being the seat of the change, seeing that the sea must be regarded as stable, unless indeed it could be shewn that the level of the sea had undergone a similar change on all the coasts it touches. Thus if the southern coast of England were found to have been depressed say to the extent of six feet, we must credit the land with the change, unless we could shew that the sea-level on the opposite or French coast had also changed. Now the alterations of land are mostly local or confined to limited areas, and are not seen in other lands bounded by the same sea or ocean as the altered portion. Hence that the land must be regarded as the unstable and the sea as the stable element, has come to be regarded as a fundamental axiom of geology.

When, therefore, the works of man—such as piers, harbours, and dwellings—become the spoil of the sea, the action has either been one effected by the force of the waves without any change of level of the land, or one in which land has simply subsided independently of the destructive action of the sea. In the extreme south of Sweden this action of land-subsidence is at present proceeding at a rate which has been determined by observations conducted for the past century and a half or more. The lower streets of many Swedish seaport towns have thus been under water for many years, and even streets originally situated far above the water-level have been rendered up as prey to the sea by this mysterious sinking of land. Linnæus (as on a former occasion we remarked) in 1749 marked the exact site and position of a certain stone. In 1836 this stone was found to be nearer the water's edge by one hundred feet than when the great naturalist had observed it; the subsidence having proceeded at this rate and degree in eighty-seven years. The earliest

Moravian missionaries in Greenland had frequently to shift the position of the poles to which they moored their boats, owing to the subsidence of land carrying their poles seawards, as, it were, by the inflow of the sea over what was once dry land. On the coasts of Devon and Cornwall the observer may detect numerous stumps of trees—still fixed by their roots in the soil in which they grew—existing under water; the site being that of an old forest which was submerged by the sinking of the land, and which has become converted into the spoil and possession of the sea. Even the long arm of the sea—the 'loch' of the Scotch and the 'fjord' of Norway—which seen in the outline of a map, or in all its natural beauty, imparts a character of its own to the scenery of a country, exists to the eye of the geologist simply as a submerged valley, whose sides were once 'with verdure clad,' and on whose fertile slopes trees grew in luxuriant plenty. The subsidence of the land has simply permitted its place to be occupied by water, and the vessel may sail for miles over what was once a fertile valley.

Occasionally the fluctuations of land may be exemplified to an extent which could hardly be expected, a fact well illustrated by the case of the Temple of Jupiter Serapis at Puzzuoli on the Bay of Naples. This temple, now in ruins, dates from a very ancient period, three marble pillars remaining to mark the extent of what was once a magnificent pile of buildings. Half-way up these pillars the marks of boring shell-fish are seen; some burrows formed by these molluscs still containing the shells by means of which they were excavated. At the present time, the sea-level is at the very base of the pillars, or exists even below that site. Hence arises the natural question—'How did the shell-fish gain access to the pillars, to burrow into them in the manner described?' Dismissing as an irrelevant and impossible idea that of the molluscs being able to ascend the dry pillars, two suppositions remain. Either the pillars and temple must have gone down to the sea through the subsidence of the land, or the sea must have come up to the pillars. If the latter theory be entertained, the sea-level must be regarded as having of necessity altered its level all along the Bay of Naples and along all the Mediterranean coasts. And as this inundation would have occurred within the historic period, we would expect not only to have had some record preserved to us of the calamity, but we should also have been able to point to distinct and ineffaceable traces of sea-action on the adjoining coasts. There is, however, no basis whatever for this supposition. No evidence is forthcoming that any such rise of the sea ever took place; and hence we are forced to conclude that the subsidence or sinking of the land contains the only rational explanation of the phenomena. We had thus a local sinking of land taking place at Puzzuoli. The old temple was gradually submerged; its pillars were buried beneath the waters of the sea, and the boring molluscs of the adjacent sea-bed fixed on the pillars as a habitation, and bored their way into the stone. Then a second geological change supervened. The action of subsidence was exchanged for one of elevation; and the temple and its pillars gradually arose from the sea, and attained their present level; whilst the stone-boring shell-fish were left to die in their homes. The surround-

ing neighbourhood—that of Vesuvius—is the scene of constant change and alteration in land-⁷ wel; and the incident is worth recording, if only to shew how the observation of the apparently trifling labours of shell-fish serves to substantiate a grave and important chapter in the history of the earth.

The statistics of wrecks and of the amount of human property which have fallen a prey to the 'sounding main' may thus be shewn to be not only paralleled but vastly exceeded in importance and extent by the records of the geologist, when he endeavours to compute the losses of the land or the gains of the sea. But on the other hand, the man of science asks us to reflect on the fact that the matter stolen from us by the sea is undergoing a process of redistribution and reconstruction. The fair acres of which we have been despoiled, will make their appearance in some other form and fashion as the land of the future; just indeed as the present land represents the consolidated sea-spoil of the past, which by a process of elevation has been raised from the sea-depths to constitute the existing order of the earth. Waste and repair are simply the two sides of the geological medal, and exist at the poles of a circle of ceaseless natural change. So that, if it be true that the sea reigns where the land once rose in all its majesty, as the Laureate has told us, no less certain is it that—to conclude with his lines—

There where the long street roars, hath been
The stillness of the central sea.

Thus the subject of sea-spoil, like many another scientific study, opens up before us a veritable chapter of romance, which should possess the greater charm and interest, because it is so true.

THE ADMIRAL'S SECOND WIFE.

CHAPTER IV.—LAURA BROUGHT TO TASK.

THE Admiral says 'good-night' to the last of his guests; then he turns to his daughter, who is evidently preparing for a speedy retreat.

'Don't run away yet, Laura; we keep early hours at Government House, but it is not very late yet.'

Rather reluctantly, Mrs Best obeys. She knows perfectly well why her father wishes her to remain, and she shrewdly suspects what subject of conversation he is likely to introduce. Now that she has had her triumph, by carrying out a pet plan with regard to Katie, that very success makes her uneasy, for she knows she will be called to account. However, she resolves to be brave, and at once leads the way to the music-room. The servants have already put out most of the lights, but here the wax-candles are throwing lustre over scattered music and deserted seats. Laura gathers up some of the songs, wondering when her father will begin, and how the attack will open. She knows it is coming, for he is restlessly pacing to and fro the room with that quarter-deck march of his, that betokens an uneasy mind.

'Why were the Greys not here this evening, Laura?'

She smooths out the leaves of an Italian duet,

lays it on the music-stand, and replies with apparent indifference: 'Because they were not invited, papa.'

'Why not? I gave you the list, and I'm certain their names were down. Why did you omit them?'

'Is it always necessary to invite the same people over and over again? The Greys have been at every party that has taken place since I came here to stay.'

'Had you any particular reason for leaving them out, Laura?' asks the Admiral, turning round quickly, as he notes his daughter's slightly scornful tone of voice.

For a moment Mrs Best is undecided. Perhaps a slight meaningless excuse will do. But only for a passing second does she think thus. Her frank loyal nature asserts itself, and she says in a quick earnest manner, with her eyes a little lowered, her cheeks a little flushed: 'I had a good reason, papa. Kate Grey makes herself far too much at home here. One would imagine she has some special privilege in this house.'

'Well, and I am always glad to see her.'

'She knows that, and presumes on the knowledge. People seeing her so much at home at Government House, are beginning to talk in a most unpleasant manner.'

'What do they say, Laura?'

'They say you mean to make her your second wife. O papa, surely, *surely* you will never do that! A girl so selfish, so ambitious, so fond of admiration, so, so—'

'Stop, Laura! The category of faults you lay to poor Katie's charge is surely long enough. So people say I mean to make her my second wife, do they?'

A flush passes over the Admiral's face, and mounts to his brow. A quick throb rises at his heart, as for the first time he hears Katie's name coupled with his own. Till this moment, his thoughts about her have been vague and unsettled. He admires her very much—more than any other lady he knows; but the idea of making her an offer of marriage has never seriously entered his head. But now, his daughter's very cautions, her very reports of the world's gossip, shadow forth to him that a marriage between him and Miss Grey may not be so very preposterous after all, not such utter madness as he himself would have called it a few months ago.

Laura, seated on a music-stool, her hands clasped before her, and her eyes fixed on her father's face, reads its meaning at once; and as a brave, a loving, and a fearless daughter, she will not shrink from the duty she believes is required of her now. 'Dear papa,' she exclaims, 'let me entreat you not to risk your future happiness! Kate Grey would never make you a good wife. She cares far too much for herself ever to study the true interests of any other person.'

'Why are you so bitter against Miss Grey?'

'I am not bitter. I only tell the real sad truth.'

Don't let her come to rule in your house ; don't let her rob me of my father's love.'

Sir Herbert draws near his daughter, and looks tenderly down at her flushed face and moistened eyes. 'Be reasonable, my child ! No one can ever rob you of my love ; but' (here he pauses, as though hesitating how to word his meaning—adding composedly enough) 'should I ever marry Miss Grey or any other lady, you must not be prejudiced against my choice, Laura. My marriage can never injure you in the least. Remember, your poor mother's fortune was all settled on you before you married Robert Best.'

'I am not thinking of money, papa. Mere money considerations do not influence me in the least.'

'Possibly not. But let me allude to the subject once more while we are talking. Robert has left you mistress of his fine estate. You have duties and responsibilities that separate you almost entirely from me now. Is not that the case ?'

'Yes. I wish I could be more with you.'

'You cannot, Laura, without neglecting your own interests. Therefore I am at times lonely—very lonely in the midst of surrounding society and occupation. My house needs a head. My heart yearns sometimes for congenial companionship. Don't grudge me happiness, Laura, if I can see my way towards gaining it.'

'I hope and pray every possible happiness may be yours, papa ; but don't look to Katie Grey for such a thing. She would marry any one to obtain position and wealth.'

Sir Herbert turns away, and walks to the end of the room ; but he soon comes back again, and sees his daughter watching him with eyes that are misty and tearful.

'I am thinking of my own precious mother. Oh, how different she was from this girl ! Miss Grey is all unworthy to take her place.'

In her earnestness, Mrs Best has risen from the music-stool, and stands before her father with great tears coursing down her cheeks. She raises her clasped hands to him in the most imploring of all attitudes. The snowy crispy dress with its white folds gives her a shadowy, almost ghost-like look ; and as her pathetic entreating face turns to the Admiral, it almost seems to him as though the soul of her mother is appealing to him through Laura's eyes. Never has the likeness struck him so much. It is as though his beloved Bess had come from the grave to bid him beware.

The daughter sees the impression she has made, and like many another, presumes too much on her success, and goes a step too far. Had she stopped at this point, perhaps her father would have given her the promise she requires, that he will not marry Kate Grey. But Laura wipes away her tears, and exclaims : 'You are coming round to my views, papa ! You are beginning to see how unfit this Katie is to be your wife. Miss Grimshaw quite agrees with me about her true character.'

Sir Herbert steps back—draws himself up to his full height. 'And what in the world does Miss Grimshaw know about the matter ?'

'She has great powers of discernment. Indeed it was she who first raised my suspicions, and set me to watch Katie's manoeuvres.'

'Very kind of her ! I ought to be particularly grateful for her surveillance !'

A cloud gathers on the Admiral's brow ; but Laura, unwarned, goes on : 'Adelaide Grimshaw is all kindness. O papa, I wish you would fix on her ! She would fill the position of mistress to your household with tact and taste, and would make you an excellent wife.'

'Thank you for your suggestion, Laura ; but be assured if ever I do marry, Miss Grimshaw will not be my choice.'

He shudders as memory recalls to his mind the lank figure of the very elderly lady his daughter commends to his notice. He recalls the faded face, the thin wiry curls, the lymphatic eyes, the bleating plausible voice, with which, in the calmest manner, she is wont to gossip over the frailties of her neighbours, and pass hard judgments on those who are younger and more attractive than herself. Then his thoughts revert to Katherine Grey. Whatever her faults may be, fortunately they are all the very opposite of Miss Grimshaw's : mind and body are altogether formed in a very different mould. After this, the conversation comes to a close, and father and daughter separate—she to lament over the Admiral's infatuation ; he to wander for an hour or two more through the dimly lighted empty suite of rooms.

Laura's words have moved him strangely. His pulse quickens as he remembers that what has been to him a half-formed purpose, a whispered secret, is already the town's talk, and that everybody is watching to see what will come next.

Has Katie herself heard of these reports, and begun to trace out the shadow of possible coming events ? Would she be very much surprised if he tried to give these airy rumours a solid foundation ?

Such is the train of thought which floats through Sir Herbert's mind long after the great house is closed for the night, and left apparently to sleep and silence. He hears the measured tramp of the sentry on the cold damp pavement outside ; the distant sound of the ships' bells in the harbour, as it is borne in by the wintry blast ; and the musical peals from the church steeples that chime the small morning hours ; but the question still rings its changes in his mind and finds no satisfactory answer.

CHAPTER V.—THE QUESTION ANSWERED.

The next morning Katie takes up her position at her father's writing-table. She has a letter to answer—a very confidential one from her friend and confidant, Liddy Delmere—and she feels bound to return confidence for confidence. Ere the epistle is finished, she starts up and thrusts it into her desk. Her eyes have been constantly wandering from the paper to the cold slippery streets, where people are jostling against each other as they make their way through the showers of falling sleet and gusts of rough wind. Surely no one would venture out except in a case of absolute necessity ; yet the girl evidently expects some one ; and by the rapid closing of her desk, no doubt the 'somebody' is in sight.

A tall upright figure may be observed emerging from the crowds of passers-by ; an officer, by the gold buttons on his rough outside coat. Guiding his umbrella, skilfully, Sir Herbert walks quickly on, and soon Katie hears his well-known knock

at the door, and his well-known step in the hall, as he takes his way to her father's library downstairs.

'He will come up here presently with some apology to me, or I'm much mistaken,' muses Kate, as she takes a swift look at herself in the glass; and ere long the door is thrown open, and Sir Herbert Dillworth announced. He glances quickly round the room, and this is what he sees: a pretty, well-harmonised interior, a blending of soft warm colours, and a blazing fire in the grate, that reflects itself in the polished steel surrounding it. And Kate Grey, the brightest point of the whole scene, is sitting beside the writing-table, and looking up with a smile to greet him. She wears a morning dress of ruby Cashmere, and a single knot of the same colour in the thick rolls of her dark hair. There is not a shadow of resentment in those lustrous eyes as she holds out her hand, frankly and pleasantly, to her visitor. Feeling perfectly self-possessed herself, she owns to a degree of satisfaction as she notices how disturbed Sir Herbert looks. The fact is his daughter's words are still ringing in his memory—'People say you mean to make her your second wife'—and he is wondering what Katie herself would say on such a subject. Will she ignore the dreary barrier of years that lies between them? Will she forget that he has gone some distance farther on in life's journey, while she is in the very prime and flush of girlhood? These thoughts flash through his mind, and make him appear nervous and absent as he begins to talk about last night's party. But his mind is made up.

'We missed you, Miss Grey. Will you pardon us that you had no invitation? My daughter is not much accustomed to sending them out.'

'Please, don't mention it, Sir Herbert. I am very glad to go to Government House when I'm wanted there; but one cannot always be invited, you know.'

'But I like you always to come. The omission shall not happen again. We had a wretchedly stupid gathering. Spare me similar disappointments in future, Miss Grey, by—by taking the right of arranging these matters into your own hands.'

The girl looks up inquiringly. Nothing can be more unsuspecting and guileless than the questioning eyes that meet Sir Herbert's.

'Will you take the right, Katie? My life has grown strangely desolate and lonely of late; will you cheer it with your presence? In short, will you be my wife?'

The question is asked now, eagerly and impatiently, and Miss Grey's eyes droop under the Admiral's gaze. This vision has been dazzling her mind so long; she has dreamt of it, thought of it; and now the offer of marriage has really come! Though the triumph is making her heart throb, she can hardly tell whether she is glad or sorry. But she does not draw back. For the treasure of Sir Herbert's loyal affection, for his true earnest love, she will give in exchange her youth and beauty. She thinks the bargain a fair one, and wonders can anything more be required.

When Sir Herbert leaves his affianced wife, he goes down to her father, to tell him of what he calls his 'good fortune.'

'Yes; and mamma and Helen shall hear all about it from me. Won't they be surprised!' adds the young lady with a short low laugh, as the

Admiral goes out of the room. She hears him close the library door, and then says to herself with another little spasmodic laugh: 'Every one will be surprised, as I am myself, to think how quickly it has all come about. Last evening I was excluded from Government House, and now I have promised to rule and reign there. Which has conquered—Laura Best or I?'

CHAPTER VI.—FAMILY COUNSEL.

Mr Grey's library is a curious little room, fitted up quite in his own way. Maps cover the sides of the walls, and a large bookcase holds the books, which are mostly nautical. Models of ships and steamers are on various shelves, there is an astrolabe near the window, and a sextant and some pattern guns on the table. Mr Grey is busy at the moment with official papers; his nimble fingers are copying a 'General Memo.' with wonderful rapidity. Hearing the stately step of his chief coming along the passage, he naturally supposes the Admiral has returned to give further directions about some orders ere long to be circulated amongst the ships. So he glances up over his spectacles pen in hand. Great is his surprise at seeing evident signs of agitation in Sir Herbert's face, as he says in a low tone: 'Put aside your papers for an instant, Grey. I want to consult you on quite another subject. I have come to ask your consent to my marriage with your daughter Katie.'

'Your marriage with my daughter, Sir Herbert!' and Mr Grey lets a huge drop of ink splash on his 'General Memo.' in his surprise.

'You seem astonished, Grey. Have you any objection to accept me as your son-in-law?'

'Pardon me, Sir Herbert, pardon my hesitation; but you startled me for the moment. I am conscious of the honour you are doing us; but have you considered how young and inexperienced Katie is? A mere girl, in fact. She is but little used to the ways of the world; hardly wise enough to hold the high position you offer her.'

The Admiral smiles. 'I will take the risk of all that. Katie is willing, and I am ready to marry her just as she is.'

'Then I give my full sanction.'

'Wish me joy, Grey. You don't say a word about that.'

'I will wish you something better and deeper than mere joy, Sir Herbert. I pray you may have true and unmixed happiness with my daughter. May she prove a wife worthy of you, and may you never regret your choice.'

There is a tremble in Mr Grey's voice as he grasps the Admiral's hand and ratifies the new bond sprung up so suddenly between them; and he looks thoughtfully after Sir Herbert as he leaves the room. Surely women are fickle, and his daughter Katie the most fickle of her sex!

Only two months ago, Walter Reeves had come into that very same room on the very same kind of mission. The same, but with a difference. He has not actually proposed for Katie, but had asked permission to visit at the house with that intention, in the event of his love being reciprocated. And Katie knows all this, and up to the present has received Walter's attentions, and seemed to take them as her right. But now all this is set aside, and a man nearly as old as her father himself

has stepped in and won the girl as a willing prize. Well may the old sailor marvel! Things have changed since the days 'long ago,' when he wooed his wife, and waited nine long years for her because he could not afford to marry sooner. His true old-fashioned love has but intensified as years have sped on; the trials of life have but drawn the wedded pair closer to each other. Will this be the experience of Katie and the Admiral?

Worthy Mr Grey cannot settle that point; so he goes up-stairs to hear what Katie herself has to say on the subject.

Miss Grey lingers in the drawing-room after the Admiral has gone. There seems something strangely sad and vague and solemn in the whole affair, now it has gone so far; and when her mother comes into the room with Helen leaning on her arm, she exclaims at once, with glowing cheeks and flashing eyes and defiant tone: 'Wish me joy, mother, and Helen! I am going to be married!'

'I'm glad it is settled at last, Katie; and I hope you will be very happy. Walter has had plenty of patience, I'm sure,' says Mrs Grey in her quiet voice, as she settles Helen comfortably on the sofa and turns round to give Katie a kiss of congratulation.

But her daughter draws back with a look of annoyance.

'Why do you talk of Walter? I am not going to marry him. My intended husband's name stands far higher in the Navy List. I'm going to be married to Admiral Sir Herbert Dillworth!'

'Sir Herbert!' exclaim Helen and her mother together.

'Yes. Why are you surprised?'

'I'm sure we've good reason for surprise, considering all that has gone on about Walter. Katie, Katie! what new fancy has hold of you now? The voice is Mrs Grey's, the tone one of reproach.

Katie is growing angry. 'The fancy is no new one, mother. Had you not all been very blind, you might have guessed what was coming long ago.'

'Do you really love Sir Herbert?' asks Helen, with that deep-seeing look of hers, that somehow always makes her elder sister a little in awe of her.

'I like him; the rest will come by-and-by; and I'm glad and proud of my lot.'

There is a ring in Katie's voice, as though she has flung down the gauntlet of self-approval, and challenges any one to take it up and contradict her. Her father is not the one to do this. He comes into the room at the moment, hears Katie's asseveration, and feels as if a world of doubt had rolled away from his mind. Considering his own word 'his bond,' he judges his daughter by the same standard. 'That's right, Katie, and sounds earnest. You may well be proud of your lot, and of Sir Herbert too: there isn't a better, braver, more honourable man alive; he's unselfish and high-principled to his heart's core. I've served three commissions under him, and ought to know him well; and I'd rather see a child of mine lying in her grave, than that she should bring discredit on his name. Kiss me, my girl! I wish you happiness. Well may you be proud of our Admiral!'

Katie receives the kiss just a little impatiently; she believes she has won 'high stakes,' and does not relish any doubts on the subject.

THE CROCODILE AND GAVIAL.

Two species of crocodile inhabit our Indian rivers, and both are especially numerous in such streams as the Ganges and its tributaries, the Berham-pooter, and many others. Sir Emerson Tennent, in his *Natural History of Ceylon*, points out an error which Anglo-Indians and others are often given to—namely, of applying the term *alligator* to animals which are in reality *crocodiles*. There are no alligators in the Indian peninsula. The true alligator is the hideous cayman of South America, and differs in one or two important respects from the crocodile of the Nile and Ganges.

The first and by far the most widely distributed of the two saurians inhabiting our Indian rivers is the common crocodile, exactly similar to the animal frequenting the Nile and other streams of Northern Africa, and known throughout Bengal by its Hindustani title of 'Mugger.' The second species is the Gavial or Gurrjal (*Gavialis Gangeticus*). This reptile is, I believe, only found in Hindustan, and is indigenous to the Ganges; hence its specific title.

The habits of the two creatures are in general very similar, but yet differ in one or two important points. The mugger often grows to an enormous size, not unfrequently reaching twenty feet in length, and is thick built in proportion. The limbs are short, feet palmated, the fore-feet furnished with five, the hind with four toes. The head (which in aspect is extremely hideous) is broad and wedge-shaped, the muzzle rather narrow, the eyes small, deep set, and of a villainous glassy green hue. The jaws when shut lock as closely and firmly together as a vice. The teeth are of a formidable description, varying much in size and length. When the mouth is closed, the tusks in the extremity of the lower jaw pass completely through and often project above the tip of the upper. The body is incased with scaly armour-plates, very thick and massive on the back, but to a less extent on the sides of the body. The reptile breathes through its nostrils, which are situated near the tip of the snout. By this wonderful provision of nature, the crocodile is enabled to lie in wait for its prey with the whole of its body, except the nostrils, concealed beneath the surface of the water.

The gavial much resembles the mugger in general structure (though the body is not usually so thickly built), with one notable exception, and that is the totally different shape and character of the snout. The jaws of the gavial are long, straight, and narrow; the teeth, which are regular, wide apart from one another, and even, are of a far less formidable description than those of the common crocodile. They much resemble in general appearance the rows of jagged teeth which garnish the edges of the upper jaw of the saw-fish. The snout is often several feet in length, and there is a peculiar knob or protuberance at the tip; and the nostrils, as in the other species, are situated near the extremity.

The gavial has been described by some writers as 'the scourge of the Ganges' and a 'ferocious animal;' but I venture to say that this is a highly

exaggerated if not an altogether erroneous statement. It is possible that occasionally—though I am convinced *very rarely*—the gaviol may seize a human being; but the reptile is essentially a fish-eater, and unlike the mugger, is little to be dreaded by the swimmer or bather. I have frequently, when strolling along the banks of our Indian rivers, observed the head of a gaviol momentarily raised above the surface of the water in the act of swallowing some large fish held transversely across its jaws, the long beak and rows of sharp teeth with which nature has furnished it, greatly assisting the creature in snapping up such slippery prey.

Crocodiles frequent the wide open channels and reaches of our large Indian rivers, especially in the neighbourhood of large towns, such as Dinapore, Allahabad, or Benares. In such resorts, whole families of both gaviols and muggers may be seen lying together side by side on points of sand or low mud islands left dry by the current of the stream; they delight to bask in the scorching rays of the mid-day sun.

The animals always lie asleep close to the margin, and generally with their heads pointing away from the water. They are extremely watchful; and on being alarmed by the near approach of some boat gliding past or human beings walking along the bank, after contemplating the objects of their suspicion for a short space of time, they one after another awkwardly wheel round, and with a splash and a flounder speedily vanish beneath the surface of the water, to reappear again so soon as the cause of their alarm has passed.

Though hideous and repulsive in appearance, these reptiles nevertheless fulfil a most useful office as scavengers. In the neighbourhood of large towns on the banks of the Ganges, hundreds of dead bodies are daily cast into the holy river by the Hindus; and in a tropical climate like India, were it not for crocodiles, turtles, and vultures assembling and devouring the corpses, speedily some dreadful plague would break out and spread death around.

Judging from the accounts of travellers, the crocodiles inhabiting the African continent must be far more dangerous than their confrères of Asia; for though we sometimes hear of muggers taking to man-eating, especially in Lower Bengal and parts of Assam, yet such practices are not the rule, as is generally supposed.

I have, however, seen patches of water near the foot of ghats or flights of steps fenced round with a close and strong hedge of bamboo stakes, driven firmly into the river-bed, for the purpose of protecting bathers or women drawing water from the assaults of man-eating crocodiles; and it is a dangerous practice at all times to bathe in pools frequented by such monsters. Cows, horses, sheep, goats, and dogs, besides the numerous wild inhabitants of the jungle, all form a prey of the mugger. The cunning animal, well acquainted with some spot where, towards sunset, flocks and herds, after the heat of the day has passed, are in the habit of drinking, there lies in wait concealed amid the sedge bordering the margin. Presently some unlucky victim in the shape of a poor bullock parched with thirst, comes hurrying down the bank and eagerly approaches the water; but hardly has its mouth reached the surface, when the blood-thirsty crocodile seizes it by the nose; and if once successful in

securing a firm grip, the chances are, that unless the herdsman is at hand to render assistance, the unfortunate bullock, in spite of struggling desperately to free itself, is soon dragged down on to its knees, and later beneath the surface of the pool.

It has been asserted that tigers ere now have been seized, and after a hard fight, overpowered by the crocodile. Possibly this may occasionally happen; but I imagine such an occurrence to be extremely rare; and my impression is, that such redoubtable champions, each capable of inflicting severe punishment on his opponent, would avoid rather than risk coming to blows.

It is generally imagined that the plated coat of mail covering the crocodile's body renders the animal invulnerable to bullets. Such may have been the case in the days of brown-bess; but a spinning conical ball fired from a Martini-Henry or other grooved weapon of the present day, will not only readily pierce, but even pass completely through the body of the largest crocodile.

It is the extraordinary tenacity of life with which all the lizard family are endowed, that has in a great measure given rise to this notion of their invulnerability; for unless shot through the head, neck, heart, or such-like vital part, the crocodile, even when desperately wounded by a bullet through the body, will almost invariably gain the water, only shortly afterwards to sink dead to the bottom, to be devoured by some of its cannibal relations.

Near a station where I happened to be quartered for many years in Central India, there was a large lake where crocodiles were known yearly to breed. After some trouble, I procured two mugger's eggs from some fishermen who frequented the spot. They were of an oval shape, dirty white colour and rough surface. The female crocodile about the month of May, having scraped a hole with her feet in the sand or mud of some dry island, deposits her eggs therein, and carefully covers them up, leaving the heat of the sun to hatch out her progeny. Meanwhile she hovers about the spot, till at length the thin layer of sand covering the eggs upheaves, the young issue forth, and escorted by the mother, take to their natural element, the water.

SHAMROCK LEAVES.

A WEDDING.

AT Irish country weddings of the lower orders, the priest is paid by voluntary contributions of the wedding guests. The marriage is generally celebrated in the evening, and is followed, especially among the farming classes, by a grand festivity, to which his "Riverince" is always invited. After supper, when the hearts of the company are merry with corned beef and greens, roast goose, ham, and whisky-punch, the hat goes round.

Honor Malone was the prettiest girl in the barony; and a lucky boy on his marriage day was the bridegroom; albeit on the occasion he looked very ill at ease in a stiff, shiny, brand-new, tight-fitting suit of wedding clothes. Lucky, for in addition to her good looks, the bride had fifty pounds to her fortune and three fine cows.

Very pretty and modest she looked seated beside the priest, blushing a great deal, and wincing not a little at his Reverence's somewhat broad jokes.

And most becoming was the 'white frock' in which she was attired; a many-skirted garment, resplendent with 'bow-knots' and trimmings of white satin ribbons.

'As good as new,' my lady's-maid at the Castle, from whom she had bought it, had assured her. 'Made by the grandest French dressmaker in all London, and worn at only a couple of balls; her young ladies were so cruel particular, and couldn't abide the suspicion of a crush or a soil on their gowns.'

In the midst of his jokes and his jollity (and with an eye to future dues, nowhere is a priest half so good-humoured as at a wedding), while apparently absorbed in attention to the pretty bride, whose health had just been drunk in a steaming tumbler, Father Murphy perceived with his business eye that preparations were being made for sending round the plate in his behalf.

The stir began at the end of the table where the 'strong farmers' mustered thickest. A goodly set they were, in their large heavy greatcoats of substantial frieze, corduroy knee-breeches, and bright blue stockings; their comely dames wearing the capacious blue or scarlet cloth cloak with silk-lined hood, which, like the greatcoat of the men, is an indispensable article in the gala toilet of their class, even in the dog-days.

In the midst of the group was Jim Ryan. Now this Jim Ryan was the sworn friend and adherent of Father Murphy; he would have gone through fire and water to serve his Reverence. He was rather a small man in the parish as regarded worldly goods, having neither snug holding nor dairy farm; but he was highly popular, being considered a 'dhroll boy' and good company.

When the proceedings of this devoted follower met the priest's business eye before alluded to, they caused considerable surprise to that intelligent organ, inasmuch as greatly to damage a very pretty compliment his Reverence was in the act of making to the bride.

First Jim Ryan took hold of the collecting plate, and seemed about to carry it round. Then, as if suddenly recollecting himself, he stopped short, and dashed it down on the table with a clatter and a bang that made Mrs Malone wince, for it was one of her best china set.

Jim's next proceeding was to try all his pockets. He dived into his waistcoat, breeches, and swallow-tailed coat receptacles, one after another, but without finding what he wanted. At last, after much hunting and shaking, and many grimaces of disappointment, he pounced on the object of his search, and drew carefully from some unknown depths a large tattered leather pocket-book.

By this time every one's attention was fixed upon him. Deliberately he opened the book, and peering inside—having first ascertained by a covert glance around that the company were observing—he extracted from it a bank-note. This, when unfolded, he spread out and flattened ostentatiously on the table, so that all who looked might read 'Ten Pounds' inscribed upon it!

A flutter of astonishment ran through the guests, not unmingled with signs of dismay among the richer portion. Fat pocket-books that a few moments before were being pompously produced by their owners, were stealthily thrust back again. A sudden pause was followed by a great whispering and consulting among the farmers. Anxious and

meaning looks were bestowed on the latter by their wives, to say nothing of expressive nudges, and digs into conjugal ribs where practicable. For there was always much rivalry in these offerings. Mither Hennessy, who drove his family to mass every Sunday in his own jaunting car, would scorn to give less than Mither Welsh; though he too was a 'warm' man, and always got top price for his butter at Limerick market. And now to be outdone by Jim Ryan! To proffer his Reverence five pounds, when the likes of him was giving ten! It was not to be thought of! So the result, after Jim had deposited his note with a complacent flourish on the plate, and had gone his rounds with the latter, was the largest collection that had ever gladdened the heart or filled the pockets of Father Murphy.

As the priest was leaving the place, Jim came up to him and laid his hand on the horse's bridle: 'A good turn I done yer Riverince this night, didn't I? Such a mort of notes an' silver an' coppers I niver laid eyes on! I thought the plate would be bruk in two halves with the weight. An' now'—in a whisper, and looking round to see there was no one listening—'where's my tin pound note back for me?'

'Your ten pound note, man! What do you mean by asking for it? Is it to give you back part of my dues, you want?'

'Ah then now, Father Murphy dear, sure an' sure you niver was so innocent as to think that blessed note was mine! Where upon the face of the living earth would a poor boy like me get such a sight of money as that? Tin pounds! I borried it, yer Riverince, for a scheme; an' a mighty good an' profitable scheme it's turned out. Sure I knew the sight of it would draw the coin out of all their pockets; an' by the powers! so it did.' A fact his Reverence could not deny, while—not without interest—he refunded Jim's ingenious decoy-duck.

THE ITALIAN GRIST-TAX.

IN our own favoured realms millers^o have their troubles, no doubt, as well as other folk, but at anyrate they are not tormented with a *grist-tax*; and indeed in these enlightened days we should have thought that such an impost was unknown in all countries claiming to have attained a high degree of civilisation. Mr Edward Herries, C.B., late Her Majesty's Secretary of Legation at Rome, in the course of his elaborate Report on the Financial System of Italy, has, however, shewn us our mistake; and in tracing the history and present position of the tax, he furnishes us with some curious particulars respecting it.

As our readers will doubtless be struck with the anomaly of a powerful government having recourse nowadays to indirect taxation to augment its revenue, it may be well at the outset to cite a brief paragraph from Mr Herries' Report, in order to shew how it happened that the *grist-tax* came to be reimposed upon the people of Italy.

Towards the close of the year 1865, he writes, M. Sella, then Minister of Finance, having to meet a deficit estimated for 1866 at upwards of two hundred and sixty-one million lire (say ten million

four hundred and fifty thousand pounds), and being compelled, he said, to have recourse to indirect taxation for a large increase of revenue, urged upon the Chamber of Deputies the revival of the grist-tax, which he considered as fulfilling more completely than any other new impost that could be found the essential conditions of great productiveness, wide diffusion, and equal pressure on all parts of the kingdom.

The impost seems to have made its first appearance in Sicily, where it was a source of revenue during the Norman period, and there, no one was allowed to carry corn to be ground without first obtaining, after much delay, a permit, for which he had to pay the duty chargeable on the grinding of the corn. The attestation of the officer in charge of the mill was requisite for the removal of the flour, for which a certain route was prescribed, and which was always to be accompanied by the permit. The miller was not even allowed to keep the key of his own mill, and was prohibited from grinding corn between sunset and sunrise. The wants of the population, however, sometimes made it necessary to relax this rule; and in such cases the miller (whose family was never to remain in the mill with him) was securely locked and barred in for the night, without any means of communicating with the outer world, whatever might happen. This treatment, however, was at length seen to be cruel; and permission was granted to any miller exposed to imminent peril from fire, flood, or other calamity, to free himself from nocturnal incarceration by breaking (if he could) through the door, window, or roof. It does not seem to have been foreseen, Mr Herries aptly remarks, that such a gracious concession might be rendered nugatory by the strength of the barriers or the feebleness of the miller!

Up to 1842, the millers themselves were considered as responsible fiscal agents; but after that time, the supervision of every mill was intrusted to an official called a 'weigher' (*custode pesatore*); but not being usually a very faithful guardian, bribery soon became rampant. In the Ecclesiastical State, where the tax was farmed out to contractors, the mode of its exaction was in many respects similar to that existing in Sicily. By an edict of 1801, which deserves notice as a legislative curiosity, a miller was liable to be sent to the galleys, besides paying a heavy fine, for a variety of offences—such as that of grinding corn not regularly consigned to him in the manner prescribed; of receiving corn or sending out flour at night; and others of similar enormity. In the district of the Agro Romano, all bread had to be stamped; and the absence of the proper stamp exposed the guilty baker to a fine of one hundred scudi and corporal punishment, or even to slavery in the galleys. The inhabitants of this district were only allowed to use bread baked within it, and they might be compelled to declare where they got their bread.

Though the tax was temporarily abolished in its last strongholds in the year 1860, it was subsequently revived, until all the statutes relating to the subject were finally consolidated in 1874. The tax, which must now be paid to the miller at the time of grinding, is charged at the rate of two lire (of about tenpence each) per hundred kilograms on wheat; and one lira on maize, rye,

oats, and barley. The miller pays periodically to the collector of taxes a corresponding fixed charge for every hundred revolutions of the millstone, to be ascertained by an instrument called *contatore*, which is affixed to the shaft at the cost of the government. The amount of this charge is determined for every mill according to the quality and force of the machinery and the mode of grinding. The miller may refuse the rate as first calculated; in which case the revenue authorities have the power to employ an instrument which will record the weight or volume of the corn ground; or of collecting the tax directly by their own officers, or of farming the tax. Should they not think fit to exercise such powers, the rate is determined by experts. The impost, it is perhaps hardly necessary to say, is an eminently unpopular one, and was only consented to under the pressure of extreme necessity.

The great difficulty in the way of the smooth working of the grist-tax was the impossibility of procuring the mechanical means of control contemplated by the law; and in point of fact, when it came into operation no effective instrument was in existence. By the end of August 1871, however, matters had changed, and no fewer than 78,250 registering instruments were supplied, and by 1874 the greater number of these *contatori* were in active operation. The *contatore*, however, does not give universal satisfaction; and Mr Herries thinks that what is wanted to remove doubts as to fair treatment, is some instrument capable of recording the weight or the quantity of wheat ground. Best of all would be the abolition of the grist-tax; but in a country where the mass of the people consume no articles of luxury which can be taxed by revenue officers, and also from whom no direct impost could be exacted, the continuation of the grist-tax seems to be an absolute necessity.

SWEET LOVE AND I.

SWEET Love and I have strangers been

These many years,

So many years.

He came to me when Life was green

And free from fears,

These present fears.

He came, and for a little space

My life was gladdened by his grace;

But soon he fled, and joy gave place

To grief and tears.

'O Love, come to me once again!'

My lone heart sighs,

So sadly sighs.

'Recall thy fearless nature, then,

Sweet Love replies,

Softly replies.

'Thou canst not? Then I cannot be

The same that once I was to thee.

There's no room in the heart for me,

Where fears arise.'

TOYS.

OF British industries, not the least interesting to a large world of readers, great and small, will be found the manufacture of toys. Mr Bartley, in treating this subject in Mr Stanford's useful series of Handbooks to British Manufactures, rightly assumes that objects which are so inseparably connected with the happiness of our early life cannot be held unimportant; while we need but mention the name of Charles Dickens, in order to lend a charm to the avocations of a doll's dress-maker and a journeyman toy-maker. Although the English productions are almost entirely confined to a few special types of goods, which not only hold their own among foreign rivals, but are largely exported to the continent, we find that in London alone there are, besides various importers of toys, eleven rocking-horse manufacturers, ten wholesale dealers, and one hundred and fifty-one retail dealers, not including the large tribe of small retailers, who combine other occupations with the sale of toys. Though Germany, Switzerland, and France are the great storehouses of all toys of which the material is soft wood, the toy manufacture of London forms a large and interesting industry.

Penny wooden toys are turned out of a manufacturing establishment which consists of a toy-maker, his wife, and family. When the father has finished his work on the lathe, the mother and children have each their particular share in gluing, pasting, and painting. The material for these articles are scraps of timber bought out of builders' yards, the principal tools being the chisel and the lathe. Pewter toys are made in London in very large quantities. At one establishment a ton of metal is consumed each month in the production of Lilliputian tea, coffee, and dinner sets. English taste may be gathered from the fact, that the number of tea-sets made is nearly thirty times larger than either of the other two. Twenty-three separate articles make up a set, and of these articles two millions and a half are made yearly by one house alone. The metal is provided from miscellaneous

goods, such as old candlesticks, tea-pots, pots and pans, bought from 'marine' store-dealers by the hundredweight; and when melted, is formed into the required shapes by different processes of casting in moulds. One girl can make two thousand five hundred small tea-cups in a day. Putting together the four separate pieces of a mould made of hard gun-metal, she fills it with the molten metal, dips its mouth into cold water, takes it to pieces, and turns out a cup that only wants trimming.

Under the head of paper toys, miniature packs of cards demand a large amount of material and labour. It is astonishing to read that one firm alone in London turns out each year *one million* packs of toy cards, using five or six tons of paper for the purpose, on each sheet of which are printed three packs in black and red. When these sheets have been pasted on cards—called 'middlings'—one girl can cut up and complete eight hundred and sixty-four packs each day, earning about one pound a week. These cards are sold at twopenny, one penny, and a halfpenny a pack. The penny cards have, as might be expected, far the largest sale with the public; the manufacturer getting five shillings for a gross of twelve dozen, or somewhat less than half the retail price. Many thousand gross of these little packs go to all parts of the world. The twopenny packs are precisely the same as the penny packs, with the addition of an ornamental paper back to each card. The demand for these superior packs is small, for when the price of an article gets above a penny, we read that it at once shuts it out from a certain class of the buying public. The purchaser that will spend more than a penny will spend sixpence. The spending public, it seems, go in sets. There is the farthing set, mostly children, who patronise small shops of toys and sweets; there is the halfpenny set; and the penny set. We then jump to the sixpenny set. There is a very large manufacture of toy picture-books which are sold at one penny, a halfpenny, and a farthing. Even the farthing books have a picture on the cover printed in four colours; and valentines

printed from wood-blocks and hand-painted can be sold for a halfpenny.

Another large industry grown up or developed of late years is the manufacture of india-rubber toys. The india-rubber, cut up into small pieces, and formed, by the admixture of white-lead and other substances, into sheets of a putty-like inelastic material, is fitted into two pieces of an iron mould, variously shaped according to the requirements of the toy, and then plunged into the vulcanising bath—a vessel filled with sulphur and other ingredients. When taken out, the india-rubber has become elastic, the two pieces of mould are unscrewed, and the toy, after trimming and painting, is ready for use.

Toy-boats, which in their construction go through fifteen different hands, are very cheap, though the whole of the work is done by hand. In one London manufactory as many as ten thousand sailing-boats are made every year; upwards of five hundred twelve-foot lengths of three-inch deals being used in their manufacture, and eight tons of lead being required for their keels.

We have left to the last place notice of the toy which is the speciality of English toy-makers, the wax-doll. The wax, after being melted in large vessels by means of boiling water, is poured into hollow plaster-moulds made in three pieces, and laid in rows with the crown of the head downwards. When the workman has filled from a can ten or twelve of these moulds, returning to the first one in the row, he pours back into his can as much of the wax as remains fluid; and so on with the other moulds. Most of the wax is thus poured back again into the can; but that which adheres to the mould has now become a hollow wax head, thick or thin according to the time which elapses between pouring the wax into the mould and pouring it out again. Then comes the process of fixing the glass eyes, which, save the very best, are now made abroad, the Germans having driven the Birmingham manufacturers out of the field. The wax ridges left by the joints of the mould are smoothed down, the surface is brushed over with turpentine to clean it, and with violet powder to beautify it; and when the cheeks have been tinted with rouge and the lips with vermilion, the head is ready for the hair-dressing operations. For the best dolls, the wig is made by a lengthy process of fixing one or two hairs at a time, so as to give a natural appearance to the hair. In the common dolls, the hair is more quickly put on in locks. The black hair, most of which comes from abroad, is human; but the favourite flaxen curls are of mohair, the silky wool of the Angora goat. *Composition* dolls' heads are made of pasteboard from iron moulds. The pasteboard is placed over a mould representing half a head cut vertically behind the ear, and is then forced by means of a pestle into every crevice. Another mould for the other half of the head is similarly filled; and when nearly dry, the two halves are removed from the moulds and pasted together. The head thus

moulded, which becomes as hard as leather, is coated with a composition of size and whiting, washed with oil and turpentine; and then having received a pair of eyes, is dipped into a vessel of melted wax, and re-dipped until it looks like a solid wax-head. The wax is then cut from off the eyes, and scraped from the part of the head which the hair will cover; and the head is then ready for painting, powdering, and hair-dressing. A third class of dolls, known in the trade by the misnomer of 'rag dolls,' is the pretty muslin-faced creature with blue eyes and becoming cap. Her face is of wax, covered with an outer skin of muslin, and is made by pressing a wax mask, moulded in the ordinary way, into a mould exactly like the one in which the wax was cast, over which is stretched a piece of thin muslin. In this way the wax necessarily adheres so closely to the muslin, that it becomes a sort of skin to the mask. These faces are nothing but masks, and require the caps to conceal the junction with the skulls, made of calico and sawdust, like the bodies. The bodies are mostly the handiwork of women and the smaller members of the doll-maker's family. The doll manufacturer gives out so many yards of calico which are to produce so many bodies, the sawdust to be found by the maker. Then by a division of labour in cutting out, sewing up, filling with sawdust, and making the joints, many dozen bodies will be turned out by one family in a week. The arms are a branch of the trade upon which certain persons are almost exclusively employed. They are made of calico above the elbow, of leather for the part below, and are paid for at the incredibly small price of sixpence-halfpenny a dozen pairs; smaller arms for very cheap dolls costing three-halfpence a dozen pairs. We read that the hands, which thus cost each the sixteenth part of a penny, have always a certain number of fingers! The materials are found by the makers themselves; so when we consider that each doll sold to the public for sixpence should not cost more than threepence in the making, if the toy-merchant and the retailer are to earn a living, there remains but a pittance to be earned by the Caleb Plummers and Jenny Wrens. Though most dolls leave their first homes in an undressed condition, the larger establishments employ many young women in the dress-making department of their trade. One article of dolls' attire forms a distinct branch of trade—the little many-coloured leather shoes, which are made from the waste material left by the makers of children's ornamental boots and shoes. A thousand such pairs are made weekly by one large manufactory in Clerkenwell.

And now we replace our puppets in their box, grateful for having been let into some of the mysteries of their creation, not only the more ready to admire the charming little picture of the toy-maker, by John Leech, in the *Cricket on the Hearth*, but more sensible of a sympathy with doll-nature, and more certain that toys are as much needed for old as for young. Happy is it if the

toys of grown-up folks cause as little mischief and as much pleasure as the innocent toys of childhood!

FROM DAWN TO SUNSET.

PART II.

CHAPTER THE THIRTEENTH.

WHEN Deborah awaked, old Marjory was sitting watching over her; the sun was still glorious on the woods outside, but the chamber was left in grateful gloom. She could not even distinguish her father's picture; but soon, clear and distinct through the gloom, laughed out the boyish face of Charlie. Charlie? What had Charlie done? Mute and still, Deborah looked up at her old nurse, while the darkness of reality dawned on her wakening mind.

'Thou'rt ill, child,' said old Marjory abruptly.

'What makes you think so, dame?' asked Deborah faintly.

'Why, thy face betrays thee; it is white as my apron, and thine was a sleep o' sorrow. I know it. Thou'lt eat summat now, an' no more o' these airs.'

'Have ye no letter or message for me, Marjory? What are you hiding there?' and Deborah raised herself in feverish excitement.

'Why, it's a letter that'll keep, I warrant me, my Lady Deb. It's from the old man at Lincoln.'

'Give it me, Marjory, and leave me, dear old dame. I wish to be alone.'

So Marjory left her; but soon the old woman was knocking at the door again with food and wine for Deborah. She found her sitting on the floor white as a ghost. 'O child, thou'rt faintin' for good victuals! There! eat and drink like a Christian. Why, bless thee, Lady Deb, dear, I know the master's in his old quandaries. But don't take on, my Rose.'

'Dame, come and comfort me. Pray, take that food away! Let me lay my head on thy kind old breast. Thou'rt a mother to me, Marjory—always wert. Dame, I've no dear mother!'

The dame took her darling in her arms, and rocked her gently to and fro, with the toil-hardened old hand stroking the girl's silken hair, and her grave old face laid against it.

'No; thou hast no mother, poor lamb; worse for thee.'

'It's hard to know right from wrong, Marjory; but I am quick to decide, and once decided, never falter. I try to do all for the best.'

'I know it, I know it. But child, my Lady Deb, have no dealin's with that old man Master Sinclair. He's a demon.'

'Hush! or give the demon his due, Marjory. He has been kind to my brother Charlie.'

'For what? We all know it; all Enderby knows what he's after.'

'That is no concern of Enderby's. I hate this gossip. Look you, dame, if I choose to wed fifty such, it is no concern of Enderby's. If I did wed Master Sinclair, it would be of mine own free will: let all the world know that!'

'But thou'lt never wed him, dearie!' cried the old nurse, in tremulous breathless haste.

'I do not answer you Yes or No; but I am my own mistress.'

'Too much so—ever too much so,' muttered Marjory below her breath.

'What say'st thou, Marjory?'

'That thou wantest a strong kind hand over thee, bein' too headstrong by half. I wish Master King was here; he'd advise thee!'

'Best not,' said Deborah, with a quick breath of pain. 'Let "Master King" attend to his own affairs. Each one has his troubles. Nurse, love me! I have need of it. O that I were a little tiny child again, when, in affright or in distress, I wrapped these arms o' thine about me; and they would seem to shelter me from all the world! O that thou wert magician, fairy, to give me my childhood back! I was happy then.'

'An' not now? What ails my bright bird? Is it Master Charlie?'

'O Marjory, don't speak of that. Look you at his picture; look there! Could those fearless eyes ever turn aside in shame or dread? Would Charlie, with all his faults, ever bring *dishonour* on us? Tell me that?'

'No, never.' The old face turned white, but did not flinch; Marjory believed in the honour of her wild boy, as in her own soul.

'Ah, Marjory, nurse, my darling! How I do love thee! No; never believe that any but a black liar would ever accuse Charlie Fleming of a mean low act. Wild, reckless he may be, but dishonourable, never! Ah, my love, my comfort, our true and faithful friend, we believe in Charlie Fleming!'

'Where is my boy?' asked the old woman, with troubled tears in her eyes. 'Why don't he come to Enderby? They will say strange things o' him if he don't come home. Oh, he'll break his father's heart by bein' so wild; but it's his father's blood that's in him.'

'And his mother's too, for they say our sweet mother was a mad, mad lass. Dame, who was she? What was my mother's name?'

The girl gazed straight at the old woman till Marjory's eyes fell, and the girl's fair face was flushed with crimson. 'I have never asked you,' she said, 'not since I was a child; but who was my mother, dame? Prithce, tell me. Ah, say not that there was shame! Poor and honest, I care not; but naught of *shame*.'

'No, my Lady Deb, no; naught o' shame. She was the child o' wedded parents, I promise thee; she was lawful wedded wife, thy mother; but if I was to tell thee who she was, Sir Vincent would strike me dead. I cannot tell thee; there's my faithful promise given, not.'

'I will not ask ye then. One day I will—must know. Does Charlie know?'

'Ne'er from me or his father. But no one knows what Master Charlie knows.'

'There's my father calling me; I must go. Good-bye, dame. Pray for me.'

Deborah went down into the hall. Sir Vincent got up and met her. He shut the door carefully, and led her to a chair; he sat down opposite her, and screening his face from the light with one great sinewy hand, gazed out from under its shadow, as if he would read his daughter's soul. For her part, she gazed at him with all her great and tender soul in her eyes, her own despair forgotten in her father's. There was a long silence between them, each gazing on the other, sorrow-stricken and speechless.

'Father,' said Deborah softly then, 'sweet father, have I not done thee some good? See! here's the letter from Lincoln; and in three weeks I shall be

Master Sinclair's wife. It is my duty, father, my free choice. My heart is very strong. Sweet father, thou'rt sad still, ay, even heart-broken; I know thy face so well! I have saved Charlie. Listen! This Master Sinclair puts everything in my power, makes me absolute mistress of all he has. My first act will be to save us from ruin; Charlie from ruin too. But tell me what more there is? What serpent has wronged Charlie falsely? ay, *falsely*, for before heaven, father, I would *swear* that Charlie has done no dishonour! Sooner would I doubt my own soul than his. He is incapable of double-dealing, incapable of all meanness and dishonesty. To doubt him, to believe for one moment that he could act dishonourably, is to believe that Charlie Fleming is no son of thine and mother's; that this Charlie Fleming is not the boy who has grown up under thine eyes and mine; graceless, truly, but the very soul of honour. Even the masters at his school, his tutors, his comrades who knew him best, have done him justice in calling him honourable and true. Then doubt him not for one moment!

Under the fire and sweetness of her faith in her brother, Sir Vincent waxed wan, and his fierce eyes grew dim with sadness.

Laying one hand upon her hands, and shading his own face still, he whispered brokenly: 'Believe on—hope on. Sweet child, sweet Deb, my brave best one, I *must* confide in thee, or my old heart will break. This boy—this son, in whom I trusted—Ah me!' and with his clenched hand on his brow and his eyes raised to heaven, the father gave a deep and bitter sob—'has *betrayed* me—his father!' With a strange hoarse eager whisper, and eyes that gleamed like a madman's, Sir Vincent leaned forward and uttered those words to Deborah. She, white, still, waited without a word for more. 'I have seen the papers—Adam Sinclair holds them—by which that boy of mine has anticipated my death, and raised money upon Enderby; his writing—his name—Charles Stuart Fleming. Adam Sinclair has got those papers out of Parry's hands; and by marrying thee, my fairest and my best, he buys those papers of Parry and destroys their shameful purport. But Deb—does that wipe out the stain? Does that blot out the fact that that boy of mine, deceiving and betraying me—ay, cursing my lengthened life, and hungering for the old man's death—has got a hound to raise this money? Ay, that hound has in turn betrayed him into Sinclair's hands; and Charles Fleming's black-heartedness is laid bare to him and me.'

'Have ye seen those papers, father, with your very eyes? And Charlie's writing?'

'Ay, ay.'

Deborah panted, terribly white and wild she looked, with her hands pressed on her side. Sir Vincent kneeled down beside her and laid his head upon her shoulder. Bitter, bitter was that hour.

CHAPTER THE FOURTEENTH.

Some days after that—it might have been centuries to Deborah Fleming—she heard a peal at the great hall bell; and Kingston Fleming, pale, disordered in dress, and haggard-eyed, entered the library. Deborah was looking idly over the books, not reading; she was stunned, and could neither

read nor write; she scarcely had the power of thought. One look at King, and she knew that he knew her fate. 'Deborah!' he said, roughly and hoarsely, 'you have played me *false*! By words strong and binding as an oath, you told your brother you would not wed Adam Sinclair—that no ruin, no misery, should lead you to so ignoble a sacrifice. Is it then under the mask of doing good, ye do this grievous evil? Soiling your soul, sacrificing your life, not to save your father and your brother, for Charles Fleming would rather see you dead than accept your bounty *then*, but to win rank and money—to shuffle off this miserable coil of poverty, that wearies you; and to sell yourself for gold and tinsel to this hoary reprobate! No good intention, no amount of self-sacrifice, could justify so detestable a deed.'

Palely beautiful, but full of calm scorn, Deborah Fleming faced her fiery and impetuous kinsman; before she spoke, her haughty eyes flashed fire and disdain.

'Kingston Fleming, are you my brother? Are you my guardian, my master, or the master of this house, that you dare to insult me thus? What earthly right have you to question or to jeer at me? Were I a man, I would strike you on the face for this. Coward! Because I am alone and a woman, you dare to insult me by these words! What if I choose to be wed to Adam Sinclair, and to love his "gold and tinsel;" what is that to you? What if I choose to "sell" my precious self for his name and fortune; what is that to you? I have my father's consent; I am under my father's protection; you have no earthly claim on me. Fair and friendly have you ever been to me. Courteous has been your kindly interest in me from childhood upwards; but scarcely enough so, to justify your interference now. I thank you, Master Kingston Fleming, for your anxiety on my account; but I'll thank you also to leave me and mine alone.'

Even in that wild moment, Kingston saw that she was trembling with fierce passion—ay, she could have struck him; in that moment, she *hated* him. But Kingston too, goaded by his wild unavailing remorse and love, mad with the knowledge of how cruelly his taunt had wronged her, desperate at her beauty and her sacrifice, cared for nothing. Dashing down his hat and whip, he caught her hands in his: 'Beautiful, cruel, heartless, reckless Deborah! Child, I have loved thee—too late, too late. I am *free*! I am free to woo thee; I am a free man now! But when I come in mad haste to ask thy love and pity, I find thee betrothed, and cast away, and *sold*! Listen! I would have *made* thee love me. No woman on earth have I loved but Deborah Fleming! I would have *made* thee love me!'

Then, with a sharp bitter cry, Deborah wrenched away her hands. Conscious of her brother's dishonour, sublime in her sacrifice, and her terrible secret and her suffering, she looked back on Kingston only with passion and scorn, to hide the love that would still master her, and hurled him back taunt for taunt. 'Ah! you are a good one to preach honour and good faith to me! throwing over one woman to woo another who is betrothed! I feel dishonoured even to have heard your words of love, when I have plighted troth to Adam Sinclair. But don't think to win or move me by thy treachery. Deborah

Fleming doesn't change her troth-plight every hour. Her vows once made, are binding, binding till death!

'Then good-bye, Deborah.' He took up his hat and whip and strode to the door. His looks were turned back on her, a smile was in his haggard eyes—intense passion, love, and suffering; his face was pale as death. His last sight of her was the proud erectness of her figure, and the bright watchfulness of her beautiful haughty eyes, following him, and burning on him. But when he was gone from her sight, the bells of Enderby, as all through their interview, came clanging wildly out, clashing on heart and brain.

'I know not if I love or hate him most!' cried the girl, half mad with her despair. 'I love him, and I hate him too!'

Then rang out the bells of Enderby, loud and clear, the refrain, 'I love him, and I hate him too!' Low in the lull, loud and clear on the gale, 'I love him, and I hate him too!'

Mistress Dinnage in those days was well-nigh desperate. After hearing that Deborah Fleming was betrothed to Adam Sinclair and was to be wedded to him in three weeks' time, she knew no rest. It was all for Charlie, it was on his account; Charlie therefore must know of this, and there would be an end of it. For two evenings Mistress Dinnage watched for her lover in vain. She had talked herself hoarse to Deborah; she had exhausted threats and entreaties: she might as well have talked to the idle wind—and so she knew—as to Deborah once resolved. On the third evening-watch, however, Margaret saw the well-known form. She was out in a moment under the gloom of the trees and the twilight.

'I have somewhat to tell you, Charlie. Let me speak quickly and clearly, love. Your sister Deborah is betrothed to Master Sinclair; they are to be wedded in two weeks and four days. There have been sad doings at Enderby. Your father! Ah! I dare not tell ye what I fear. But oh! grievous trouble has he been in through tidings from Master Sinclair about *you*! So Mistress Deborah promised then and there to be Master Sinclair's wife. Oh, I tell you she is desperate since! She loves another; I know it; but she gives up all for you and Enderby.'

'Can this be true! Meg, I will kill him first. Has he betrayed me then? What tidings has he sent?'

'I know not; but of terrible losses, be sure. Ah, dear, are ye not in terrible trouble, and waiting about for love of me? Stay no longer, Charlie! Think not o' me; I will follow; I've got good courage. Release sweet Mistress Deborah.'

'How, quotha? Death only will release that mad reckless girl. Ah! I might have known her.'

'Neither prayers nor commands, Charlie, would she listen to; no, not if you were rolling in riches now, she says she would not break her oath. Charlie! O love, what do I urge you to! You must fight that old man, and we must fly. Not to kill him, Charlie, hark ye!—not to kill him; but to disable him for what life he has left! Think me merciless, unwomanly; I care not, so that it saves her. Or stay, stay, Charlie! Will ye use all your influence first to turn him? O ye can talk to tenderness a heart o' stone! Talk to Adam Sinclair then till he melts to pity; but set sweet Deborah free!'

'Talk to him!' said Charlie Fleming, with a short laugh; 'ay, I will *talk*. But we have old accounts to settle first, old debts to square. We have a little affair to settle between ourselves, Adam Sinclair and I. Hark ye, Meg! He has accused me of foul play—not to my face, not he! but behind my back. He has accused me of cheating at cards—a dirty trick to brand on a man; and as ye know, love, whatever Charlie Fleming's faults, he would scorn so foul an act. I don't mind telling ye now, Meg, that I must wipe off this slander with blood. All my comrades are up in arms at it; and even *now* I am on my way to Lincoln, to meet Adam Sinclair face to face; and in case I fall, Meg—to bid thee now farewell.' He took her in his arms; he folded back the long dark hair from the passionate face. In bitter wrath and passion had she trembled at hearing of the foul slander put on his fair fame; and her fiery spirit, following the spirit of his words, had made her grasp his hands, and pant and frown in eagerness for revenge. But when she pictured him dead—lying perchance beneath the old man's deadly shot, stiffening in his blood, in the perished glory of his youth and strength—then her woman's heart began to shudder and to faint: she leaned on his broad breast and moaned.

'What! sick?' he whispered. 'Faint? A little *polltroon*! The wife of a Fleming must be brave. *Thou* wouldst hate and despise Charles Fleming if he could for one moment brook such an insult as this. Come; I meant to bid thee good-bye, and hide this from thee; but now I have told thee all, thou must face death with me, and take it as it comes.'

'I know it! I know it! Not for one moment would I say aught but "Go!" Yet, pity my woman's fears; think how long I have loved but thee! Ay, I have kissed the stones where thy shadow passed! and to lose thee now, *now*—my husband of but a week, my darling *husband*! Nay; I will not grieve before 'tis time!' she cried with sudden fire, gazing up at him. 'See! I am so brave that I would fain be thy second, and see thy true shot speed to that old coward heart! Oh, thou'lt kill him, Charlie, thou'lt kill him, or hurt him sorely. A dead-shot he may be; but men say thine is deadlier. Nay; do not laugh; I have listened, till I know better than thou canst know thyself, all Charles Fleming's brave gifts. They say thou'rt a deadly shot.'

He stooped and kissed her. 'A deadly shot! Yes; I will shoot him for love of *thee*. Better not mangle the old traitor; I will kill him clean, or not at all. Thank heaven, if he kills me it will be clean! Love, if I fall, don't weep; *I leave a hope with thee*.' These words were whispered; she did not answer, she did not speak.

A few more happy stolen hours, and he was gone. She went with him to the gate in the woods, where he was wont to come and go, through the mossed entrance and the tangled clambering ivy. There they stood, her hand upon the gate; her dark head, that reached no higher than his heart, laid there. The mute clinging hand did not escape him; every motion, every gesture of his young love, was marked by his keen hawk eyes, as if it were her last. He pulled open the stubborn gate; still the two clung as if they would never part.

'Sweet love, good-bye.' He listened for her

answer, but only heard a sob; kisses were Margaret's good-bye—kisses, and the deathless love within them. Then her arms fell asunder, and leaning against the gate, she let him go. With the iron grasped within her little hands, she stood gazing through the bars and saw him wave adieu; still stood, while the quick hoofs bore him far away; still stood, gazing for him through the night, though Mistress Margaret Fleming (for Mistress Fleming indeed she was) saw him no more!

COD-FISHING IN ICELAND.

THOUGH the French are not naturally a maritime nation, there is a hardy race of fishermen to be found on the coasts of Normandy and Brittany, from whose ranks are obtained a large proportion of the hands that are employed in the cod-fishing of Newfoundland and Iceland. Though it is a painful and dangerous occupation, there are few that offer a higher remuneration to the masters and crews; the shoals of fish are inexhaustible, and the demand is always greater than the supply.

It is, however, not always easy to get up the necessary complement of hands; and captains sometimes have recourse to the unlawful acts of the press-gang of former days. A ship ready to start will enter a little creek on the coast of Brittany near an almost unknown village; and after mass on Sunday, the captain announces at the church door that he is in want of men for Iceland. The advantages are loudly proclaimed: good food, good wine, brandy, meat three times a week, and above all, an immediate bounty of from four to eight pounds, with future pay in proportion to the results. The extreme poverty of the peasants makes such a sum of money seem fabulous; they have only to say Yes. And yet, how hard it is to them to leave their beloved home and speak the fatal word! The captain knows how to overcome their irresolution. Installed in a neighbouring *cabaret*, he patiently waits until some young and vigorous men enter, when he pours forth all his eloquence, enumerates the advantages, slurs over the danger and fatigue, shakes the gold in his purse, orders an abundance of cider and brandy, and in the end, draws his victims into the net.

The engagement is signed; and the labourer, who has spent the winter in collecting sea-weed for the fields and sowing his crops, leaves the women to manage the rest. All being favourable, he will return in September with twenty pounds in his pocket. A few voyages make him a good sailor, when he can be drafted into the fleet at Cherbourg, thence to be transformed into a servant of his country.

From the difficulty of obtaining men, French shipbuilders reduce the labour by mechanical appliances; so that five or six men will navigate ships of two hundred tons. But in cod-fishing craft it is necessary to have as many men as possible, and twenty are usually taken. The arrangements are woefully insufficient. There are only sleeping-places for a third; one sailor resting whilst two are fishing. Thus, after six hours spent on deck without shelter from rain, wind, and snow,

the waves washing over and the heavy line in their hands, the men go down stiff with cold and worn out with fatigue. Yet they must lie dressed as they are, on a hard damp mattress; and frequently the clothes are never changed from the beginning to the end of the voyage.

After five voyages a man is authorised to take the command, and though styled captain, he is nothing more than the head of the fishermen. It is his work to keep the account of the number of cod caught; the sailors taking care as they hook a fish to cut out its tongue and place it in a bag hung to their belt. When the hour of repose comes the tongues are taken to the captain, and about ten centimes is allowed for each. The second in office is only chosen as being the most skilful with his line; then comes the man who cuts off the cods' heads, opens and prepares the fish for the salter; and lastly the one who lays them in the barrels and closes them for sale.

With this short description of the crew we will pass over the voyage, as described by a French writer, M. Aragon, and take the reader to the Icelandic coast, Patrix-Fiord, where a number of vessels are already collected. Deserted during the past season, it now presents a scene of the greatest animation. A man-of-war is there to provide for any repairs that may be needed; carpenters and blacksmiths are busy doing their work, the bay echoes with the noise of hammers and saws. Other vessels, called *chasseurs*, come from France to take away the fish. On the shore rises the little wooden hut of the *cornan*, a Danish merchant who lives there during the summer months to trade with the people and sell spirits. No night comes on to interrupt the incessant labour; during the middle of May the sun is never below the horizon, and but a few stars may be seen on the zenith about the end of June.

Those ships that have chosen their position for fishing take down their sails and lie as quietly at anchor as the wind will permit, the men standing in a close line at the side of the vessel. They are clothed from head to foot in knitted or flannel garments, with waterproof capes and hats. A petticoat of strong linen is tied round the waist, descending below the knees, and to preserve the feet from wet they wear woollen stockings and waterproof boots. Thick woollen gloves lined with leather save their hands from the injury of constant friction from the heavy line. The whole forms a curious picture of ragged, patched, greasy, well-tarred habiliments, which a comic pencil might rejoice to portray. The men, indifferent to their appearance, seek only to be saved from moisture. The lines they use are necessarily very heavy to bring on board a fish weighing say forty pounds. There are two hooks baited with the entrails of fish; but the voracity of the cod is such that it is scarcely necessary to be too particular as to the lure. Thus the men stand for six hours consecutively, gently moving the line, and when a shake indicates a catch, lifting the heavy weight on board.

The fatigue is very great, and much of it is pure loss, as the line too often brings up another fish, called the *flétan*, which though very good to eat, does not bear preserving. The sailors hold this interloper in extreme aversion, as it often breaks the line by its weight, and gives them much trouble to heave on board.

Let us now take a glance at the scenery which surrounds these hardy seamen. The coast is broken up into large gulfs, strewn with shoals and reefs of a most dangerous character, where misfortunes are so frequent that the place is called by the fishermen 'The Ships' Cemeteries.' Enormous precipices line the coast, with heaps of volcanic stones, worn by the action of the waves, lying at the foot. These rocks are cut at certain distances into spaces like the mouth of an immense river, called fiords, which communicate with the sea by a comparatively narrow inlet, and spread out into a sort of lake, surrounded by vertical and jagged rocks. The more sinuous the outlet, the more sure is the anchorage; and in each bay there is generally found one sandy spit, forming a sort of natural jetty, behind which the ships are secure, and where the cooman builds his hut. Far away in the distance rises the gigantic cone of the extinct volcano Snæfells-Jökul, whose summit is covered with rosy-tinted snow. In the hollows of the rocks thousands of sea-birds build their nests, to be slaughtered by the inhabitants at a certain season for the sake of *fuel*, their flesh being utterly unpalatable to the least fastidious appetite.

One of the most important fiords is the Dyre-Fiord, where a small hamlet of a dozen huts or *bars* is built in a large meadow. These constructions are not easy to describe; they are low and massive, formed of lava-stone and peat. To avoid cold and damp within, a very small door opens into a dark narrow passage, towards which the rooms converge. The walls and pointed roof are covered with turf, upon which grows a thick crop of grass, making it very difficult to distinguish the *bar* from the field in which it stands. Within, the accommodation is most simple—a kitchen and one sleeping-apartment, with closets to contain provisions, clothes, and fishing apparatus. Beyond the vegetable garden is a building for drying fish, the planks of which are separated to admit the free circulation of the air. Here the decapitated cod are hung, emitting a savour far from pleasant. The heads form the food of the Icelanders with butter and milk; the fish are sold for export. The sea-wolf is also largely eaten, though its flesh is tough and rancid, the frequency of leprosy and elephantiasis in the island being attributed to this unwholesome diet.

Men and women, masters and servants, all inhabit the same room, whilst cleanliness is not much attended to; but poor as they are, and accustomed to great privations, they set an example of cheerful contentment. The beauty of the young girls is remarkable; their fair hair falls in long plaits, partially covered by a black cloth coif, daintily worn on one side of the head, and finished at the top with a tassel of coloured silk run through a silver or steel buckle, which floats on the shoulder. It reminds the traveller of the Greek head-dress; but the blue eyes with their sweet benevolent expression soon recall to his mind their Danish origin. The dress is made of the cloth woven in the country, and on festival days the bodice is gaily adorned with silver braid and velvet, whilst the belt and sleeves are ornamented with silver devices, beautifully chased and often of great value. On wet and cold days the shawl becomes a useful mantilla, completely enveloping the head, and defending the wearer from the effects of the frequent storms.

The people offer the most generous and cordial hospitality to all travellers, and especially to shipwrecked mariners. An opportunity for proving this hospitality once occurred in the open and dangerous bay of the Westre-Horn, surrounded by breakers and reefs. Here forty vessels were fishing on a fine morning in March, when the breeze began to freshen. The cod was abundant, and the men were tempted to stay too near the coast. All the vessels but five doubled the point; these beaten back by the enormous waves, and not daring to raise a sail, were broken on the rocks. Thirty men reached the shore, sixty-six found a watery grave. The *Sea-bird* struggled long, until breaking up, all perished excepting the mate and cabin-boy; the former had received a severe wound in the leg by falling on some broken glass. Tied to the rigging, together they awaited their fate, frozen with cold, the waves washing over them. After three hours the boy expired of exhaustion; and the mate unloosing the ropes was soon thrown on to the shore. The corpses of his friends were lying around him, the survivors having gone inland for shelter; but with great difficulty he followed them, crossing streams and marshes, sinking into ice and snow at every step, his wounded leg torn by the sharp points. Six weary hours were thus passed, when his heart-rending cries at length reached two Icelanders, who carried him into a *bar* not far off.

For five months these good people nursed and tended the sufferer. At the end of that time he was still confined to bed, but the healing had begun. A vessel was sent round to bring him away; yet his hosts evinced much sorrow at the prospect of his departure. At their request the captain left him one night longer, when the shipwrecked mariner was escorted to the beach by the whole family, all manifesting a deep emotion. After thanking the father, not only for his care of the survivor, but also for the burial he had given to the victims of the storm, the captain assured him that the French government would indemnify him for the expense he had incurred; but the good man only pressed his hand, declaring that he had done his duty, and deserved neither indemnity, thanks, nor recompense. The Minister of Marine sent a gold medal to him after hearing of his generous conduct.

Robbery, murder, and theft are almost unknown in this peaceful little country; not a soldier or policeman is needed even in the capital Reikiavik; a fact which fully proves the virtues of the Icelanders. Travellers have asserted that the hospitality was not quite so disinterested as it appears, and there may be an exception in certain localities, such as the road to the Geysers, traversed every year by many tourists. Here the Lutheran ministers offer shelter in their churches, which are transformed into hotels, and provide fish, milk, and coffee for those who need it at a certain charge. Roads are almost unknown; the configuration of the ground wholly prevents their formation. The island has been the scene of such tremendous volcanic action that the mountains are heaped together in the most fantastic manner. From the glaciers which cover the summits of extinct volcanoes rush torrents of water, bringing down the disintegrated rocks to accumulate in the valleys below.

Yet in the midst of these convulsions, Nature

does not forget her rights, and wherever a little earth can be found there grows a tuft of grass. Meadows undulating with the rocky ground cover it with a green mantle, and in summer the botanist will find most of the wild-flowers which bloom in our temperate climates. During the winter, the water infiltrating through the soil turns the whole into an impassable marsh, where the unwary traveller may sink into quicksands of the most dangerous character, since there is no exterior sign to denote their existence. In a country whose natural configuration scarcely admits of carriage-roads, ponies are invaluable, their robust constitution defying alike climate and fatigue. Small in size, quiet and patient, they resemble the Corsican or Pyrenean breed. Such is their docility, that the most inexperienced rider may mount without fear, and trust to their instinct in the difficult mountain passes. Three or four thousand are exported yearly into England, where they are used chiefly for coal-mines; and such is the estimation in which they are now held, that their cost has largely increased.

The eider-duck is one of the most profitable sources of revenue, and strict laws prevent their wanton destruction. A gun is not allowed to be fired near the places they frequent, for fear of alarming them; thus they have become so tame that they allow themselves to be stroked without fear. They choose the islands for their homes—where their deadly enemy the fox cannot reach them—and the steep barren rocks in the fiords. Many of the owners clear a thousand a year by the sale of the down, without any expense. It is scarcely necessary to make laws for the preservation of game, since shooting is a pleasure the Icelanders wholly despise. The curlew, snipe, golden plover, and wild-duck abound, as well as the delicate white partridge; but the natives despise them as food, and prefer smoked or dried salmon, with which their streams abound.

In the middle of August the greater part of the French ships meet in the Faskrud-Fiord before starting home. By this time the snow is beginning to fall and fœe to form around the bays. Detached icebergs make their appearance in forms as singular as varied, sometimes resembling fantastic animals or the prow of a ship. The anchors are raised, and the convoy leaves the wintry shore; and anticipations of home once more dawn on the weary fishermen.

THE ADMIRAL'S SECOND WIFE.

CHAPTER VII.—COMING HOME.

PREPARATIONS for the much-talked-of marriage are pushed on rapidly; and before the spring flowers are making the slopes of Hayes Hill glad with their brightness, the wedding—a very quiet one—takes place. Laura Best is not present, though everybody says how charmingly she has acted towards Katie. She called on the bride-elect, and on the wedding morning a short perfumy note of congratulation and a handsome set of opals arrive as a marriage gift. Sir Herbert is pleased at his daughter's attentions to his bride, and is glad that after all such a friendly feeling has sprung up between them.

The fact is, Laura Best, finding that opposition

cannot prevent the marriage, has decided to give it her apparent sanction. Not for worlds would she interfere with the happiness of the wedded pair or throw unpleasantness on their path. So she quietly does all that is needful in the way of proper attention, and then goes home to Hayes Hill to her children and duties there. Yet in secret she bears a heavy heart with her, and mourns over her father's infatuation.

If the Admiral's wedding has been a quiet one, the home-coming is destined to be quite the reverse. The whole town of Seabright wakes up, and great preparations are made to welcome the pair. The ships in the bay are illuminated, flags flutter in the breeze, and bells peal out their jubilant chimes.

Katie smiles proudly to herself as she walks through the lofty apartments of Government House, and feels she is mistress there now. It is pleasant to roam about everywhere, and know that she has the right to do so; pleasant also to stand in the shade of the deep window, and listen to the joyous pealing of the bells, which she knows are pealing for her. Wealth and rank are in her grasp; she has entered on the honours of her new position, and will rule with no timid hand. Self-confident and fearless, she laughs to herself in utter exultation at the warnings, the croakings, the forebodings that a while ago assailed her. Walter Reeves is very angry indeed, when he finds out how unceremoniously he has been set aside; and he is intensely bitter against Katie in the first flush of his disappointment; so doubtless it is fortunate for all concerned that his ship, the *Leo*, is ordered off on a cruise in the Mediterranean. He will be away for nearly twelve months, and surely in that time the most poignant heart-wound may be healed. Besides, change of scene is all-potent in such cases!

As months pass away, Lady Dillworth's tastes rapidly expand and assert themselves; ere long she becomes the leader of society in Seabright, and the most fashionably dressed woman there. Sir Herbert is generous beyond measure; Katie must not have a wish ungratified, or a desire unfulfilled if he can help it. And so the young wife, loving admiration and homage with a wild passion, basks in them to her heart's content. The semi-official parties at Government House, stately and dignified as they were, rapidly give place to balls and quadrille assemblies, to late hours and overcrowded rooms. The junior officers of the ships rejoice at the change; while the older ones shake their heads ominously, and gradually withdraw themselves from excitements that have no longer any charms for them.

Lady Dillworth is the belle on all occasions. Whether she entertains the company with her rich voice as she sings for them, or delights them with her sparkling conversation, or whirls with some favoured ones through waltz or galop, she is ever the attraction of the evening.

If the Admiral sometimes thinks there is rather

too much gaiety, and longs to have Katie now and then all to himself, he does not say so, for he cannot bear to deprive her of any enjoyment on which her heart is set. Often and often during the season, at Katie's old home, sounds of the rattle of carriages come up to the cosy drawing-room, and the lamps flash for a moment on the blinds.

'There they go—another party at Government House, I suppose!' Mr Grey will say, as he quietly looks up from his books.

'Yes, my dear; Katie is giving a ball to-night, and such a magnificent dress she has got for it! Sir Herbert grudges her nothing.'

'So much the worse for Katie. Spending is an art easily learned; and where in the world she gained her education on that point, I am puzzled to know. Not from you, Sarah; you were always economical.'

'Katie's position is different from ours, dear; she must keep it up.'

'But she has no need to keep up such an endless whirl. I wonder the Admiral is not tired to death of it. I should be, I know.'

And so, all through the quiet night, husband and wife are roused every now and then from their slumbers by the rattle of passing wheels; and Mrs Grey sighs to herself about Katie's love for excitement, but will not blame her aloud, even to her husband's ears.

CHAPTER VIII.—RETURN OF THE 'LEO.'

December comes round again with its blustering winds and rude gales; there is every prospect of a spell of rough weather, and Captain Walter Reeves looks with intense satisfaction at his gallant ship the *Leo*, again riding securely at her anchor in Seabright Bay.

A season on shore just now, when festivities are about to commence, is in his idea far preferable to being tossed about on a squally sea or cruising about from port to port; so he congratulates himself on being ordered home. He hears of the gay doings at Government House, and how Katie is the reigning belle of Seabright; and he listens placidly, without one throb of emotion. Time has proved a panacea. He has no pang of regret that Sir Herbert is the husband of this very attractive woman of fashion, instead of himself. As a matter of duty, he is on his way to call at Government House, when outside a fashionable shop in one of the streets he sees a well-appointed carriage drawn up, and in it he catches a glimpse of a well-known form and face. An obsequious shopman is standing on the edge of the curb-stone displaying some articles of bijouterie; a coachman in dark livery, with a black cockade in his hat, is holding the reins. It is Lady Dillworth. There is no mistaking her imperial manner, as she speaks out in that slightly commanding voice; neither is there any mistaking her handsome face, her brilliant eyes, her dark coronal of hair, as she sits there in her proud beauty. Walter, as he crosses the street, takes note of her velvet, her sealskin, and the feathers and the damask rosebuds in her bonnet, and thinks all this suits the Admiral's wife very well. He hears her say to the shopman:

'The price is eight guineas, you say. Are the stones real?'

'Yes, my Lady; and they are very fine and well set. You are the first to whom I have had the honour of shewing them.'

'Send one of them to Government House. Or stay,' adds she musingly—'I want another for a present for a friend; so you may send me two bouquet-holders.'

'Sixteen guineas for such rubbish as that! I'm very glad the money comes out of the Admiral's purse, and not out of mine. A poor Commander's exchequer would not stand many such attacks as that,' thinks Walter, rather ungallantly, as he now greets the occupant of the carriage.

Katie is surprised to see him, and says so as she holds out her daintily gloved hand. 'I had no idea the *Leo* had returned. Have you been long here?'

'I arrived only last night, and am on my way to Government House.'

'How unfortunate there is no one at home! Sir Herbert went to Belton Park this morning, and I am on my way to the station to meet a friend who is coming to stay with me. By-the-by, you know the young lady—Liddy Delmere. Do you remember her?'

'Isn't she very pretty and a blonde?'

'Yes; she has both those attractions.'

'And doesn't she sing nicely?'

'O yes! Liddy can sing if she likes; and her voice is not a bad soprano,' replies Lady Dillworth with one of her brightest smiles.

'Then I'm sure I've often met her at your house in former days.'

'You had better come and refresh your memory this evening. We shall be quite alone, and very pleased to see you at Government House.'

Captain Reeves is of course delighted to meet Lady Dillworth on such friendly terms. He accepts the impromptu invitation at once.

The past, with its shadows and disappointments and jealousies, is gone for ever. Better now to banish every recollection of it from his heart, and meet Katie on an entirely new footing.

As if by tacit understanding, they both decide this is the wisest plan. They meet and separate as mere every-day acquaintances. Nothing can be more unembarrassed than her ladyship's smile as she acknowledges Walter's parting bow, and drives off, to the admiration of the staring urchins in the street.

'Quite alone' is a mere relative term with Lady Dillworth; for when the footman throws open the drawing-room door on that evening to announce Captain Reeves, the latter sees the room is already half full of guests. Katie stands near the piano; her dark velvet dress falls in sweeping folds, unbroken by flounce or trimming; the beautiful set of opals—her step-daughter's wedding present—shine out with a subdued light from neck, arms, and breast. Beside her is Liddy Delmere, who in her bright blue silk dress, and with her sunny hair tied with ribbons of the same azure tint, forms a contrast to her hostess, in which neither loses.

Ere long, Walter finds himself seated beside Miss Delmere, for they have renewed their acquaintanceship with mutual satisfaction, and plunge at once into discursive recollections of the past.

'We had some pleasant times together in the days long ago,' begins Walter.

'O yes; I remember meeting you several times at Mrs Grey's, also at a picnic on Bushby Plain, and at a gipsy party. Hadn't we capital fun sometimes?'

'Yes, really. What a pity these happy days are over. We never can recall those bright fresh hours, when the heart gilds everything with a magic glamour.'

'Speak for yourself, Captain Reeves! For *my* part, I enjoy things as much as ever I did; and my heart "gilds" a good deal still. Do tell me some of your adventures. What have you been doing all the months you were away?'

'Nothing worth relating. I neither discovered a desert island nor a new race of savages. I really have no wonders to narrate.'

'How marvellous! The very lack of incidents makes the thing curious. Now, if I had been cruising about in the *Leo* for months, I should have gleaned materials enough for at least two volumes of travels.'

'Ah! you ladies draw largely on the imagination. My experience is just this: I went away from England last spring; I return again in time for the Christmas pudding.'

'You sailors are all alike. I never met one yet who could give me the merest sketch of his voyage—all seems a blank, but the going and returning,' Liddy asserts laughingly.

'We had some nice balls at Malta,' replies Walter, rousing himself with a sudden recollection. 'Had you? Who gave them?'

'Sometimes *we* did; and crowds of the prettiest girls I ever saw, came.'

'Very flattering to the givers.'

'Oh, I wish you could see the *Auberge de Provence* when it is made ready for a ball; it looks just like a fairy scene. The old knights of Provence would never recognise the place if they could return to take a peep at it. As one passes through the hall, it appears like an orange grove; the trees are full of golden fruit and fragrant blossoms; and clusters of coloured lamps shine out like rubies through the green leaves.'

Walter is fairly launched into his subject now; one recollection speedily calls up another, till Liddy and he grow eloquent, and enjoy themselves amazingly.

He begins describing some musical charades they 'got up' at Malta.

'How nice they must be! But I can't quite understand them.'

'We merely take a word, divide it, and make our singing descriptive of the parts, instead of acting them out. For instance, take Ravenswood.'

'A sweet word, particularly if one has to croak out a raven chorus! Oh, I should like that extremely!' laughs Liddy.

'Ah, no; you don't catch my meaning. We make quite a grand affair of it, have a drop-scene, on which birds and trees are painted, and our illustrations are from the opera of *Lucia di Lammermoor*.'

'Quite a musical drama on a small scale, I declare! I wish we could get up something of the sort here. I'll ask Lady Dillworth about it. And here she comes.'

Katie walks over, looking rather amused at the evident good understanding between Liddy and Walter, as they thus interchange recollections with much *empressment*. She seats herself

beside them, and the subject is discussed in all its points. Lady Dillworth enters into it with impulsive eagerness. Already she is longing for something new and fresh, something that will cause a sensation among the 'upper ten' at Seabright.

Several other guests join them, and ere long an animated group of people are professing willingness to aid such a charming scheme; anything novel is so attractive to those whose whole life is excitement. Walter takes the initiative at once.

'I have all the music we need. The band-master of the 25th arranged it for me with the songs, duets, and choruses. It's capital for drawing-room practice, if we can only get enough performers.'

Everybody is ready to join, so the *rôle* is settled on the spot. Walter is to be Edgar; Liddy, Lucy Ashton. But here the young lady enters a protest.

'I don't wish to be Lucy. If you want me, you must let me be Lucy's mother. I make a splendid old woman.'

'Then who will be the unfortunate bride?—Will you, Lady Dillworth?' asks Major Dillon, turning towards her.

'O yes, if Miss Delmère objects.'

So it is settled. Walter infects the whole party with his eagerness. Scenes, music, costumes, and arrangements are talked over; and Katie is all anxiety to carry out the plans with due effect. Walter is to bring on shore the music-scroll and sketches of the costume; and the intended performers are invited to meet him to-morrow morning at Government House, for the first rehearsal.

'Now that affair is settled, we'll have some music,' Katie says, as she rises and goes towards the piano. Walter follows her. 'Have you forgotten all your songs, Captain Reeves?'

'O no. How could I! You taught me most of them,' he replies.

'Will you try one now?'

'Don't ask me to sing a solo. I should break down at once; but if you will allow me to join you in a duet, I'll try to manage it.'

Katie turns over a book of manuscript music, and they fix on *Then and Now*.

'The words are dreadfully stupid, but the air is pretty,' asserts Lady Dillworth, as she runs over the prelude:

We heard the tower bells pealing
On that soft summer night,
Your hand was linked with mine, love;
Your heart, like mine, was light.
We whispered low together
Of that hope and of this;
While far above, the joyous bells
Seemed echoes of our bliss.

Again those bells are pealing;
We hear them now, and sigh;
No longer can their chimes, love,
Blend with our thoughts of joy.
Our lives for aye are parted;
And on the wintry air,
Those crashing sounds but haunt us now,
Like echoes of despair.

The two voices ring harmoniously and plaintively through the rooms. One could almost imagine the singers are actually using the 'past to give pathos' to the words. But nothing is further

from their thoughts. Katie is only deciding that, after all, Walter's voice will 'do' with hers in the duets of the charade; and Walter is wishing—just a little—that Miss Delmere had retained the part of Lucy, as at first proposed.

ELECTRICITY AS A LIGHT-PRODUCER.

It has long been the opinion of scientific people that in electricity we have a power the development of which is only at present in its infancy. The marvellous details of our telegraphic system constantly remind us that there is a mysterious fluid round about us which can to a certain extent be made subservient and obedient to the will of man. This familiarity with that which would a few centuries ago have been stigmatised as the outcome of sorcery, has led the ignorant to place a blind belief in its powers. The subtle fluid has in fact taken the place of the necromancer's wand, and is believed by many to be capable of anything or everything. The electrician is thus credited with much that does not of right belong to his domain, and the wildest speculations are occasionally indulged in as to what next he will do for us. That electricity will prove of far more extended use than the present state of knowledge allows, we all have vague anticipations, and among these is the reasonable hope that it will some day supersede coal-gas as a means of artificial illumination. We propose, by a brief review of the present position of electrical research, to point out how far such a hope is justified by facts.

Sir Humphry Davy was the first to discover that when the terminal wires of a powerful electric battery were furnished with carbon-points and brought into such a position that they almost touched, the space between them became bridged over with a dazzling arc of light. The excessive cost of producing this light (owing to the rapid consumption of the metal-plates and acids which together form the battery-power) rendered it for a long time almost inapplicable to any other purpose than that of lecture-room demonstration. But it was evident to all that a means of illumination so nearly approaching in its intensity the light of the sun, would, if practicable, be of immense value to society at large. Apart from its cost, there were many other hindrances to its ready adoption. The incandescent carbon-points—which we may here remark are cut from a hard form of gas-coke—were found to waste away unequally. Some plan had therefore to be hit upon of not only replacing them at certain intervals, but also, in view of this inequality of consumption, of preserving their relative distance the one from the other; otherwise the light they gave became intermittent and irregular. These difficulties were met by employing clock-work as a regulator, and more recently by a train of wheelwork and magnets set in motion by the current itself. These arrangements naturally led to complications, which required the constant supervision of skilled operators, and the coveted light was necessarily confined to uses of a special nature where the question of cost and trouble was unimportant.

The use of the battery for the electric light has for some years been almost entirely superseded by the magneto-electric machine. The construction of this machine is based upon Faraday's discovery, that when a piece of soft iron inclosed in a coil of

metal wire is caused to pass by the poles of a magnet, an electric current is produced in the wire. The common form of this machine consists of a number of such iron cores so arranged upon a revolving cylinder that in continual succession they fly past a number of stationary horse-shoe magnets placed in a frame round its circumference. By a piece of mechanism called a commutator, the various small streams of electricity thus induced are collected together into one powerful current. This invention forms one of the most advanced steps in the history of the electric light. But although it produces electricity without the consumption of metal involved in the battery system, another element of cost comes into view in the expense of the steam-power necessary to work it; besides which the original outlay is considerable.

In the year 1853 a Company was formed at Paris for producing (by the aid of some large magneto-electric machines) gas for combustion, by the decomposition of water. The Company failed to produce gas, and what was perhaps more to the annoyance of the subscribers, they failed also to shew any dividends, and the expensive machines were voted impostors. However, an Englishman, Mr Holms, succeeded in turning them to better account, and eventually produced by their aid a light of great power. Mr Wilde of Manchester was another worker in the same field; and improved machines were soon introduced to public notice by both gentlemen. A few years after, the South Foreland and Dungeness lighthouses were provided with experimental lights. (The first-named headland had previously been furnished with an oxyhydrogen or lime light, a source of illumination which is also open to the same objections of requiring constant attention and renewal.)

It is a matter of surprise to most visitors to the South Foreland lighthouse to find that a small factory and staff of men are necessary to keep the electric apparatus in working order. The extent of the establishment is partly explained by the fact that, in case of a breakdown of any part of the apparatus, everything is kept in duplicate. Hence there are two ten horse-power steam-engines, and a double set of magneto-electric machines, although only half that number are in actual use at one time. The old oil-lamps are also kept ready, in view of the improbable event of both sets of electrical apparatus going wrong.

Although lighthouses were the first places to which electrical illumination was applied, there are many other purposes for which that species of light is invaluable. One of the chief of these is its use in submarine operations. Unlike other lights, being quite independent of atmospheric air or any kind of gas for its support, and merely requiring an attachment of a couple of gutta-percha-covered wires for its connection with the source of electricity (which may be at a considerable distance from the place of combustion), it is specially applicable to the use of divers. The importance of a means of brilliantly lighting the work of those engaged in clearing wreck or laying the foundations of subaqueous structures cannot be over-estimated. There is another service too in which we may hope some day to see it commonly employed: we mean as a source of light to our miners. For this purpose, the burner could be placed in a thick glass globe hermetically closed;

in fact the globe might even be exhausted of air, for experiments prove that the light is in several respects improved when burnt in a vacuum! The danger of fire-damp explosion would by this means be almost altogether obviated; for unless the glass were broken (and abundant means suggest themselves for protecting it), no communication could be made between the light and the gas-laden air of the mine. As a means of night-signalling, the electric light can also be profitably applied. This can be done by an alphabet of flashes of varying duration; the readiness with which the light can be extinguished and rekindled by the mere touch of a wire, rendering it peculiarly adapted for such a purpose; while the distance at which it can be seen is perhaps only limited by the convexity of the earth. Several of Her Majesty's ships are now being fitted with the electric light, which is to serve both for signalling purposes, and as a precautionary measure against the attack of torpedo-boats. For military field operations a brilliant light is often useful; and an electrical apparatus is in actual use by one of the belligerents in the present war. In this case, the light is doubtless worked by an electric battery, as a steam-engine is hardly a convenient addition to the impedimenta of a moving column.

Having called our readers' attention to the several special public uses for which the electric light is available, we may now consider how far it can serve us for the more common wants of every-day life. In its crude state as we have described it, governed by such a touchy thing as clock-work, it could not possibly compete with gas for ordinary purposes. But one or two improvements have within the last few months been made, which have led many to hope that the day is not far distant when the light will become common in our streets, if not in our houses.

These improvements are two in number. The one is a plan whereby the electric current can be subdivided so as to serve a number of different lights, and the other is an improvement in the arrangement of the burner. The first-mentioned invention seems most certainly to bring the system more on a par with gas-lighting, only that wires take the place of pipes. But the second offers features of a more novel character. The carbons, instead of being placed point to point, one above the other, as in the old system, are put side by side and made into a kind of candle. The carbons therefore represent a double wick; while the portion of the candle usually made of tallow is made of kaolin, a form of white clay used in the manufacture of porcelain. The points are thus kept at a fixed distance apart; and as they burn, they vitrify the kaolin between them, which both checks their waste and adds, by its incandescence, to the light produced. The old difficulty of keeping the carbons apart by the aid of clock-work, therefore disappears. The invention of this 'electric candle' is due to a Russian engineer, M. Jablochhoff. Another plan which is also credited to the same inventor is that of doing away with the carbon-points altogether, and substituting for them a thin plate of kaolin. The light produced is said to be softer, steadier, and more constant than that obtained by any previous method. Successful experiments with M. Jablochhoff's invention both in France and England have shewn it to be readily applicable to many purposes. It was

lately tried at the West India Docks, London, where its power of illuminating large areas for the purpose (among others) of unloading ships by night, was fully demonstrated. Moreover, its portability is such that it can be carried into the depths of a ship's hold. We may mention as a result of these experiments, that the various gas companies' shares have been depreciated to a considerable extent.

Meanwhile, improvements in the magneto-electric machine have not been wanting; Siemens in England and Gramme in France have succeeded in obtaining intense currents from machines far less bulky than those of the old pattern. But still steam-power is required to set them in motion, and until this is obviated, we cannot expect that the electric light can become really available for more general use. The inventors claim that their method of illumination is, for the amount of light obtained, far cheaper than any other known, pleading that one burner is equal to one hundred gas-lights. * But we must remember that for ordinary purposes this amount of light is far beyond our needs. In factories where steam-power is already available, and where the light would supersede a large number of gas-burners, it can of course be employed with profit. Indeed we learn that at several large workshops in different parts of France the light is in actual use with the best results. Some of the railway stations both there and in Belgium are also making arrangements for its immediate adoption.

The problem, however, which has now to be solved is, whether the light can be made available for domestic purposes. We fear that the necessary motive-power presents an insuperable objection; for although, as we have explained, one engine will feed a certain number of lights, it will bear no comparison in this respect with the capabilities of a small gas-holder. Besides which, a man would have far more difficulty and expense in starting a steam-engine in his back-garden than he would have (as is commonly done in country districts) in founding a small gas-factory for the supply of his premises. Without losing sight of the benefits which coal-gas has given us, we may hope that it is not the last and best kind of artificial illumination open to us. It blackens our ceilings and walls; it spoils our books and pictures, besides robbing our dwellings of oxygen, and giving us instead a close and unhealthy atmosphere. The combustion of electricity is on the other hand, as we have already shewn, *independent of any supply of air*; and instead of vitiating the atmosphere, it adds to it a supply of that sea-side luxury ozone, which may truly be said to be 'recommended by the faculty.' Besides these advantages, it can be used without any sensible rise of temperature. Another great advantage which its use secures is its actinic qualities, which would enable artists and all whose work depends upon a correct appreciation of colours, to be independent of daylight.

In conclusion, we may say that, beyond the special uses for the electric light which we have enumerated, and for which it has by experience been found practicable, we see no likelihood of its more general adoption until two requisites are discovered. The one is a substance that will, without wasting away and requiring constant renewal, act as an incandescent burner; and the

other is a cheap and ready method of obtaining the electric fluid. For the former we know not where to look, for even the hardest diamond disappears under contact with the electric poles. But with regard to the latter, we cannot help thinking how, many years ago, Franklin succeeded by the aid of a kite-string in drawing electricity from the clouds. Is it too much to hope that other philosophers may discover some means not only of obtaining the luminous fluid from the same source, but of storing it up for the benefit of all?

JAPANESE WRESTLERS.

It is a fine clear day in February; and the bright sun shining without a cloud to impede his rays, lights up the hull of *H.M.S. Tyne*, swinging lazily round her anchors in Yokohama Bay. Scarcely a ripple can be seen on the surface of the water, and numberless boats are darting to and fro, conveying passengers from the various ships to the shore. On board the corvette the blue-jackets and marines are reclining about the fore-castle smoking and sewing, for it is Thursday afternoon, the day set apart in English men-of-war for the men to make and mend their clothes; a concession which Jack values the more for the privilege of smoking all the afternoon which accompanies it. Clearly it is not a day for any one to remain cooped up in a ship, who is not detained there by duty. So think we officers; for most of us have shifted into plain clothes, and are ready to go ashore. The officer of the afternoon watch, who is endeavouring to beguile the weary four hours he has to spend on deck by levelling his spyglass at every object far and near, looks gloomily at a party of us getting into a sampan, and remarks, with a view to cheering us up, that the glass is falling rapidly, and he expects dirty weather before the night; he wouldn't go ashore if he could, &c. But we have been at sea too long to be persuaded out of anything by a little chaff; so with a parting joke at our grapes, we get into the crazy little sampan, and manage to seat ourselves without capsizing her, a work of some little difficulty. The four half-naked, muscular little fellows who form our crew work their long sculls with great vigour, keeping time to the beat of the unwieldy oars with a shrill monotonous chant, whose burden is 'Go ashore! go ashore!'

It is a glorious view that lies before us on that bright winter day. The long esplanade, or *bund*, that fringes the shore is lined with the tall white houses of the foreign settlement, to the southward of which is the beautiful wooded hill called the Bluff, the white cliffs of which are dazzlingly bright in the sunlight. The bungalows of the foreign residents are for the most part on the Bluff, each house inclosed in its own beautiful grounds; and here too, about two miles from the settlement, is the race-course, an invariable accompaniment to any large gathering of Englishmen in the East. Yokohama itself lies in a valley between the Bluff on the one hand and the Kanagawa hills on the other; but inland rises range after range of lofty mountains, and towering far above everything is the snow-capped crest of Fusi-yama, the 'peerless' mountain of Japan, which is forty-five miles distant from the bay where our ship is lying. Fusi-yama is a volcano in the shape of a truncated cone, but no eruption has taken place for more than a century; a fortunate thing for the country, as fifty

thousand people are said to have perished at its last great outbreak, which almost destroyed the capital, Yeddo. Shocks of earthquake are very frequent, though slight, in Yokohama and the neighbouring town, Kanagawa; in fact, most of Japan is subject to these volcanic disturbances, which occasionally cause great damage. It is on this account that the houses are built generally of such slight materials, as they can endure shocks which would infallibly overthrow any building constructed after the European fashion. In the summer, when the snow has melted from the top of Fusi-yama, bands of pilgrims dressed in white, who have come from all parts of the empire to worship the peerless mountain, throng in great numbers along the roads at its base. At this season the ascent is often accomplished by foreigners for the sake of the magnificent view which is obtained from the summit on a clear day; though whether it is worth while going through so much to obtain so little is of course a matter of opinion. Many people will tell you they go up for the sake of saying they have been there, forgetting that any one who has not been there can as easily say the same thing. For my own part I never could see the object of climbing a mountain only to come down again on the other side, and therefore in my numerous excursions into the interior of Japan, I gave Fusi-yama a wide berth. Ponies are usually employed by those who believe in the merits of four legs as compared to two; and the deep ashes which cover the upper part of the mountain render this mode of ascent preferable to the severe labour of climbing on foot. The weather is so clear on the day in question that the deep gullies down the sides can be easily traced by the naked eye as we are pulling ashore.

While we have been admiring the beauties of the scene, our sampan has passed round the projecting arm of the English Hatoba, a stone jetty which protects the landing-place from the heavy swell which often sets into the bay; so we land and make our way to the bund with some difficulty, owing to the crowd of coolies who are passing to and from the merchants' godowns with heavy packages slung on bamboo poles between two men. Now comes the question, how are we to pass our time? for amusements are somewhat limited in a small settlement like Yokohama. To be sure, we can go to the club and play billiards or bowls or read the papers; but the afternoon is so fine that it seems a pity to waste it indoors. We might spend a few hours very pleasantly in the Benten Doré, a street filled with shops for the sale of lacquer-work and curiosities of different sorts; but unfortunately it is nearly the end of the month, and I need scarcely tell any one acquainted with the manners and customs of naval officers that our dollars have grown small by degrees and beautifully less, and we are anxiously waiting for payday.

The most popular idea seems to be to walk round the race-course to Mississippi Bay, on the south side of the Bluff, the favourite drive of the Yokohama ladies; but just as we have resolved on this, a man passes making some proclamation in a high sing-song tone, which seems to meet with general approval from the natives. On inquiring, we find that he is announcing the arrival of the champion troupe of wrestlers, who intend giving a performance that afternoon on a piece of waste

land just outside the boundaries of the foreign settlement. Nothing could have happened more apropos; so jumping into some of the odd-looking little hand-carriages which ply for hire in great numbers about the streets of most Japanese towns, we are rattled along the streets at a rapid rate by the active little drivers, who seem to possess the enviable faculty of never tiring, for they trot along as gaily at the end of a thirty miles' run over indifferent roads, as when they started. On arriving at our destination, we find numbers of natives on the same errand, 'gaily dressed in their Sunday best,' entering an inclosure which has been hastily made out of long bamboos covered with matting, to keep out the too curious eyes that would gaze at the performance gratis. A payment of a quarter *bu* each (about threepence in English money) admits us to the interior, which presents a very striking scene. Round the sides of the large inclosure are numerous bamboo stages, crowded with the wealthier class of natives and a few foreigners; while in the amphitheatre some thousands of people are assembled, many of them women, whose gay robes set off their attractions to perfection.

Every one has his holiday face on, and the ceremonious politeness which usually characterises the meeting of any Japanese, has for the time given place to mirth and gaiety. Itinerant vendors of cakes and sweets ply their trade among the crowd with much apparent success; and here and there is a stall for the sale of *saki*, a strong spirit brewed from rice, and much resembling inferior sherry in the taste and smell. There is a total absence of intoxication, and I may say very few drunken men are ever to be seen about the streets. By the time we have mounted a stage, and settled down on the chairs a neatly dressed *musume* (young girl) has procured for us, the performances are about to commence, and a man is giving out the names of the first pair of wrestlers.

In the centre of the amphitheatre a mound has been raised, on which a ring has been formed by banking up the earth to the height of a few inches. Two grave-looking elderly men, apparently the judges, now seat themselves upon mats on the mound, and unfurling their paper umbrellas, light their pipes, and commence smoking in dignified composure; while the two wrestlers doff their *kimonos* (robes) and enter the ring perfectly naked but for a cloth round the loins. They are very far removed from our idea of what an athlete ought to be, for though muscular, they have an ungainly heaviness of figure. Weight is indeed thought of such importance in these contests that men are fattened for them like prize cattle, under the mistaken belief that such size is an advantage to the fortunate possessor!

A tedious preliminary performance has to be gone through before the actual business of wrestling commences. Each man comes to the centre of the ring, and squatting down in front of his antagonist, raises each leg in turn, and then brings it down heavily on the ground, at the same time striking his thigh smartly with his open hand. I suppose this is meant as a sort of challenge; but it has an extremely ludicrous effect, at least to foreigners, to see two very fat men so employing themselves. Both men now quit the ring and take a draught of water and a pinch of salt, while they rub their arms and hands with mud, in order that they may

get a better hold of each other's naked body. At length they re-enter the ring, and the real struggle now begins. They squat in front of each other like two huge frogs and strike their hands together, at the same time uttering a curious hissing noise, which gets louder and louder till they suddenly fly at each other like angry cats. Heavy blows and slaps are exchanged freely in the effort to close, but umpires are behind each shouting out cautions at any attempted infringement of the rules on either side. When they have fairly got hold of each other many a cunning feint and twist is shewn, and the struggling bodies and limbs entwine so rapidly that the pair look like one gigantic octopus. At length the bout is concluded by one man being hurled bodily out of the ring into the crowd outside, and the cheering from the excited spectators is absolutely deafening. The victor stalks about the ring for some time in great dignity, receiving the congratulations of his friends, and then repeats his former challenge, striking his thighs heavily and crowing like a bantam cock. Another wrestler, nothing daunted, at once comes forward to try his fortune; while the vanquished combatant, who has picked himself up amidst a running fire of chaff from the unsympathising crowd, resumes his *kimono* with an assumed air of indifference and vanishes behind the spectators.

Three men in succession did the first victor overthrow before he found a foeman worthy of his grip; but he too in turn soon succumbed to a fresh challenger. The judges during all the confusion maintained their seats in great dignity, and smoked away with quiet unconcern while the wrestlers strove and kicked beside them. Their office seemed to be to settle any disputes; but it was almost a sinecure, as I saw hardly any during the afternoon, everything being conducted with perfect fairness and good-humour. All the hard work seemed to be done by the umpires, who were dancing about each combatant in a perfect state of frenzy, and their repeated screams of '*Anatta! anatta!*' (Sir! sir!) when any unfair movement was attempted on either side, soon reduced their voices to mere croaks. To win a round, a man had either to lay his opponent flat on the ground or thrust him out of the ring. Several of the first bouts we witnessed were decided in the latter manner, a heavy man driving his antagonist clean out of the circle by the weight and impetus of his first assault. Any method whatever seemed to be allowed in catching hold; I saw one man win a heat by dexterously catching his opponent by the scruff of the neck and jamming his head on the ground, the whole body perforce following suit. This seemed to be regarded as a sort of 'fool's mate,' for I noticed that the loser was much laughed at; and although the same manoeuvre was attempted several times afterwards, it was never successful.

The light weights had their contest first; and then came the middle weights, if such a term can be applied to men of fifteen stone at least. But the real event of the day was the concluding struggle between the champions, about a dozen in number, who would have passed muster in any assembly where height and strength were the test. Not one of them was under six feet in height, and most of them were considerably over; one gigantic fellow must have been nearly seven feet. All of them were disfigured by the same inordinate

amount of flesh; but the muscles of the arms and legs were very powerfully developed, and the activity displayed in spite of their enormous size was something marvellous. In one severe contest the gigantic champion threw a lesser athlete clear out of the ring on to the heads of the spectators below, overwhelming one of the unfortunate judges in the transit. The latter, however, soon arose, gave himself a shake, and resumed his pipe and seat, apparently none the worse for his rude shock.

The final contest of the day, which took place just before dusk, was between our friend the giant and the next biggest of the band; and after a severe struggle, ended in the former being thrown as scientifically as ever I wished to see. The earth shook with the violence of the fall; but the vanquished hero picked himself up at once, and with a good-humoured laugh at his opponent, resumed his *kimono*; and the sports were concluded.

Not the least amusing part of the afternoon's amusement was afforded by a blue-jacket on leave from the *Lyre*, who threw his cap into the ring, and wanted to try conclusions with the biggest man of the party for a few dollars. A long and amusing conversation took place between the sailor and the natives; but the challenge was not accepted, so Jack put on his hat and walked jauntily away. He was a tall powerful man, and I daresay could have held his own against the giant himself, in spite of his inferiority of weight; for it is a well-known fact that the enormous amount of flesh cultivated by the Japanese wrestlers stands seriously in their way when opposed to a foreigner in good condition. It is not very many years ago that a shining light of the English Church in the East came to Japan and astonished the natives by throwing some of their best men. No doubt, before many years, the Japanese, who are very quick at seizing any new idea, will perceive the folly of feeding their athletes to such a size, and follow the English system of training. A very noticeable feature about these contests was the perfect good-humour with which they were conducted, not a single man losing his temper, in spite of the heavy blows and cuffs which were exchanged with great vigour before closing with each other. While discussing the afternoon's amusement, we walked to the bund in the twilight, and a twelve-oared cutter soon took us on board in time for dinner. Next morning at daylight we were under weigh for Hong-kong.

SHAMROCK LEAVES.

A WAKE.

TIM SCANLAN, while he lived, was only a labouring man; but he was well liked in the country; and it was expected that his funeral would be an unusually large gathering. Crowds flocked to the wake, and a great provision of tea, whisky, pipes, and tobacco had been made. The widow occupied her post of honour at the head of the coffin, and displayed a fair show of grief, joining in with vociferous weeping whenever the 'keening' was led by the older women. She was young enough to have been the dead man's daughter, having come to his house a 'slip' of a servant-girl, whom he had married and ruled over very masterfully.

As the night wore on, the whisky began to tell on those outside the room where the corpse lay. The noise increased, and soon apparently became loud enough to 'wake the dead,' as the saying is; for to the consternation and amazement of every one present, the defunct, after a deep sigh and sundry groans, opened his eyes and struggled up into a sitting posture. When the startled company had recovered from the shock, poor Tim was lifted out of the coffin; whisky was liberally poured down his throat; and well wrapped up in blankets and seated in the big chair by the fire, he gradually revived from the trance or stupor that had been mistaken for death. The last of the guests had departed from the cabin, and Tim, still propped up before the fire, was left to the care of his wife. Instead of coming near him however, she slunk off, cringing timidly away into a dark corner behind his chair, whence she directed frightened glances at her resuscitated spouse.

'Mary!' said the man in a stern voice.

No answer.

'Are you there?' peering round, his face quivering with anger and weakness.

'Yis, Tim, I'm here,' faltered Mary, without stirring.

'Bring me my stick.'

'Ah, no, Tim; no! Sure you never rose yer hand to me yet! And 'tisn't now, when you're all as one as come back from the dead, that'—

'Bring me my stick.'

The stick was brought, and down on her knees beside the big chair flopped the cowering wife.

'Well you know what you deserve. Well you know, you young thief o' the world! that if I was to take and beat you this blessed minute as black as a mourning-coach, 'twould be only sarving you right, after the mean, dirty, shameful turn you've done me!'

'It would, it would!' sobbed the girl.

'Look here!' gasped Tim, opening his breast and shewing an old tattered shirt. 'Look at them rags! Look at what you dressed up my poor corpse in; shaming me before all the decent neighbours at the wake! An' you knowing as well as I did about the elegant brand-new shirt I'd bought o' purpose for my berrin; a shirt I wouldn't have put on my living back—no, not if I had gone naked in my skin! You knew I had it there in the chest laid up; and you grudged it to my unfortunate carcase when I couldn't spake up for myself!'

'O Tim, darlin', forgive me!' cried Mary. 'Forgive me this once, and on my two knees I promise never, never to do the likes again! I don't know what came over me at all. Sure, I think, the devil—Lord save us!—must have been at my elbow when I went to get out the shirt; tempting me, and whispering that it was a pity and a sin to put good linen like that into the clay. Oh, how could I do it at all?'

'Now, hearken to me, Mary,' and Tim raised the stick and laid it on her shoulder. She knew

he wouldn't beat her even if he could with his trembling hands; but she pretended to wince and cover away. 'Mind what I say. As sure as you do me the like turn again, and go for to dress me in those undacent rage, I tell you what I'll do—I'll walk.'

'O don't, Tim, don't!' shrieked Mary, as pale as ashes. 'Murder me now, if it's plazing to you, or do anything to me you like; but for the love of the blessed Vargin and all the Saints, keep in yer grave! I'll put the new shirt on you; my two hands 'll starch it and make it up as white as snow, after lying by so long in the old chest. Yer corpse will look lovely, niver fear! And I'll give you the grandest wake that iver man had, even if I had to sell the pig, and part with every stick in the cabin to buy the tay and the whisky. I swear to you I will, darlin'. There's my hand on it, this blessed night!'

'Well, mind you do, or 'twill be worse for you. And now give me a drop of wather to drink, and put a taste of sperrits through it; for I'm like to faint with thirst and with weakness.'

Mary kept her promise; for such a wake was never remembered as Tim Scanlan's, when, soon after, the poor man really did depart this life. And the 'get up' of the 'elegant brand-new shirt' in which the corpse was arrayed, was the admiration of all beholders.

CARRIER-PIGEONS.

THE value of these birds as carriers of messages was interestingly demonstrated at the siege of Paris, as it used to be in the French war seventy years ago, before the invention of the electric telegraph. It now appears that carrier-pigeons may be employed with advantage in taking messages from boats engaged in the Scottish herring-fisheries, when no species of telegraph is available. The following notice of the fact occurs in the *Fishing Gazette*:

'The experiment which was tried last year of employing carrier-pigeons for the purpose of bringing early intelligence each morning from the fishing-ground of the results of the night's labour, is again being resorted to this season, and with the most satisfactory results. One of the birds is taken out in each boat in the afternoon; and after the nets have been hauled on the following morning and the extent of the catch ascertained, the pigeon is despatched with a small piece of parchment tied round its neck, containing information as to the number of crans on board, the position of the boat, the direction of the wind, and the prospects of the return journey, &c. If there is not wind to take the boat back, or if it is blowing in an unfavourable direction, a request is made for a tug; and from the particulars given as to the bearings of the craft, she can be picked up easily by the steamer. The other advantages of the system are that, when the curers are apprised of the quantity of herrings they may expect, they can make preparations for expediting the delivering and curing of the fish. Most of the pigeons belong to Messrs Moir and Son, Aberdeen. When let off from the boats, the birds invariably circle three times round overhead, and then sweep away towards the land with great rapidity, generally

flying at the rate of about a mile per minute. Two superior birds in Messrs Moir's possession have occasionally come a distance of twenty or twenty-five miles in as many minutes; and on Tuesday one of these pigeons came home sixteen miles in the same number of minutes. Another of Messrs Moir's pigeons flew on board the *Heatherbell* on Tuesday afternoon off the Girdleness, bearing a slip of paper containing the intelligence that the boat from which it had been despatched at 11.54 had a cargo of twenty-five barrels of herrings. The pigeons require very little training, and soon know where to land with their message. A cot has been fitted up on the roof of Messrs Moir's premises at the quay for the accommodation of the birds, and they invariably alight there on their return from sea.'

According to the London newspapers, there was lately an amusing experiment to test the flight of carrier-pigeons against the speed of a railway train. The following is the account given of this curious race, which took place on the 13th July: 'The race was from Dover to London between the continental mail express train and a carrier-pigeon conveying a document of an urgent nature from the French police. The pigeon, which was bred by Messrs Hartley and Sons of Woolwich, and "homed" when a few weeks old to a building in Cannon Street, City, was of the best breed of homing pigeons, known as "Belgian voyageurs." The bird was tossed through the railway carriage window by a French official as the train moved from the Admiralty Pier, the wind being west and the atmosphere hazy, but with the sun shining. For upwards of a minute the carrier-pigeon circled round to an altitude of about half a mile, and then sailed away towards London. By this time the train, which carried the European mails, and was timed not to stop between Dover and Cannon Street, had got up to full speed, and was proceeding at the rate of sixty miles an hour towards London. The odds at starting seemed against the bird; and the railway officials predicted that the little messenger would be beaten in the race. The pigeon, however, as soon as it ascertained its bearings, took the nearest homeward route in a direction midway between Maidstone and Sittingbourne, the distance "as the crow flies" between Dover and London being seventy miles, and by rail seventy-six and a half miles. When the continental mail express came into Cannon Street station, the bird had been home twenty minutes; having beaten Her Majesty's royal mail by a time allowance representing eighteen miles.'

The Conductors of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice: 1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.'

2d. To insure the return of papers that may prove ineligible, postage-stamps should in every case accompany them.

3d. Manuscripts should bear the author's full CHRISTIAN name, surname, and address, legibly written.

4th. MS. should be written on one side of the leaf only.

5th. Poetical offerings should be accompanied by an envelope, stamped and directed.

Unless Contributors comply with the above rules, the Editor cannot undertake to return ineligible papers.

SEA-MONSTERS.

WHETHER the sea contains any creature at all answering to the popular idea of a 'sea-serpent'—that ophidian monster which is annually reported to have been interviewed by various crews and persons—is a problem which will only be solved by the actual capture of one of those visitors. There are, as will presently be pointed out, certain well-known true sea-snakes, the *Hydrophidæ* of the Indian Ocean, which swim by means of their compressed fin-like tails; but whether these marine serpents will correspond to the 'sea-serpents' of popular tales, is a matter deserving further investigation. The wide ocean presents features well suited to tempt the imagination to stray into the wildest flights. Its vastness; the difficulty of exploring even a small portion of its surface, as well as its enormous depths; its capacity for containing the strangest and most gigantic objects that fancy can picture: these are attributes of the mighty deep that have ever attracted the attention and prompted the weird imaginings of man.

It is a curious fact that recent scientific research has revealed the existence in the sea, at the greatest depths, of most minute and wonderfully formed organisms, the beauty and rarity of which necessarily secure our admiration; but instances of animals of enormous size being met with beyond those already known, are few and far between. This fact may be accounted for by the circumstance that while it is easy to construct instruments for capturing the smaller creatures living in the deep, it is a very different matter to entrap and secure an unseen monster, whose very size must endow him with enormous strength. The whale, so far as we know, is the largest denizen of the deep. Whether it is possible that it can be equalled by giants of some other order or race, is the point which public curiosity is very keen to have settled.

The appearance of great snakes at sea is recorded by more than one old voyager; but it would seem to have been only of late years that the idea of their existence has been generally

confined to one, familiar to us all as the 'Great sea-serpent.'

In *Opuscula Omnia Botanica*, Thomas Johnsoni, 1629, we have an account of a great serpent captured off Sandwich by two men, who found it stranded among the shoal water by the sea-shore. It is described as being fifty feet long, and of a fiery colour. We are also told that they conveyed the carcase home, and after eating it, stuffed the skin with hay, to preserve it 'as a perpetual remembrance of the fact.'

In David Crantz's *History of Greenland*, published in 1766, we have an extract (illustrated by a drawing) concerning the *kraken*, from the narrative of a Captain Paul Egede, supposed to be the brother of a famous Danish missionary of the same name. The *kraken*, it is however necessary to remark, is the northern name for a giant cuttle-fish, the existence of such a monster being now a matter of scientific fact.

'On the 6th of July 1734,' says this old seaman, 'as I was proceeding on my second voyage to Greenland, in the latitude of the Cape of Good Hope, a hideous monster was seen to raise its body so high above the water that its head overtopped our main-sail. It had a pointed nose, and spouted out water like a whale; instead of fins it had great broad flaps like wings; its body seemed to be grown over with shell-work, and its skin was very rugged and uneven; when it dived into the water again, it threw up its tail, which was like that of a serpent, and was at least a whole ship's length above the water; we judged the body to be equal in bulk to our ship, and to be three or four times as long.'

Eric Pontoppidan, Bishop of Bergen, celebrated in his days as a naturalist, though he never actually saw it or met any one who, *had* seen it, believed implicitly in the great sea-serpent existing somewhere; and in his writings has a good deal to tell us about its ways and habits; and it is upon record that Sir Lawrence de Ferry, commander of the old castle of Bergen, not only saw the monster, but shot at it on the high seas, wounded it, was pursued by it, in its pain and

fury, so closely that he narrowly escaped with his life.

In 1801 there was cast ashore on the coast of Dorsetshire a snake twenty-eight feet in length and twenty feet in circumference; but this has since been alleged to have been a Basking-shark; and the same has been said of a great snake-like carcass that was beaten to pieces by a tempest, and cast ashore on one of the Orkney Isles in the autumn of 1809, and some fragments of which, the *Scots Magazine* for that year states, were lodged in the Museum of the Edinburgh University.

A very distinct description of the sea-serpent occurs in Dr Hooker's *Testimony* respecting it, and communicated to Dr Brewster's *Journal of Science*. About half-past six o'clock on a cloudless evening at sea, the doctor heard suddenly a rushing noise ahead of the ship, which at first he supposed to be a whale spouting, but soon found to be a colossal serpent, of which he made a sketch as it passed the vessel at fifty yards' distance, slowly, neither turning to the right nor left. 'As soon as his head had reached the stern, he gradually laid it down in a horizontal position with his body, and floated along like the mast of a vessel. That there was upwards of sixty feet visible, is shewn by the circumstance that the length of the ship was a hundred and twenty feet, and that at the time his head was off the stern, the other end had not passed the main-mast. . . . His motion in the water was meandering, like that of an eel; and the wake he left behind him, was like that occasioned by a small craft passing through the water. . . . The humps on his back resembled in size and shape those of a dromedary.'

Dr Hooker states further, that the description precisely accorded with that of a serpent seen five years before by Captain Bennet of Boston. At a later period, three officers in Her Majesty's service—namely, Captain Sullivan, Lieutenant MacLachlan, and Ensign Malcolm of the Rifle Brigade—beheld a similar creature gambolling in the sea near Halifax; but they asserted that it was at least one hundred and eighty feet in length, and thicker than the trunk of a moderately sized tree. Nor must we forget the official account which was transmitted in 1849 to the Lords of the Admiralty, by Captain Peter McQuhae of Her Majesty's ship *Dædalus*, past which, he and his crew saw the great sea-serpent swimming merrily—a document which produced, or provoked, a learned paper in the *Westminster Review*; while Professor Owen asserted that what was seen from the deck of the *Dædalus*, would be nothing more than a large seal borne rapidly southward on a floe or iceberg.

Recently, the appearances of the serpent have been amusingly frequent and clearly detailed. He has been seen in the north seas and the south seas, and in many places nearer home; in the Firth of Forth, off Filey Bay and the North Foreland, off Hastings and the Isle of Arran, the Menai Strait and Prawle Point; and in 1875, a battle between it and a whale was viewed from the deck of the good ship *Pauline* of London, Captain Drevar, when proceeding with a cargo of coals from Shields to Zanzibar, destined for Her Majesty's ship *London*. When the *Pauline* reached the region of the trade-winds and equatorial currents, she was

carried out of her course, and after a severe storm, found herself off Cape Roque, where several sperm-whales were seen playing about her. While the crew were watching them, they suddenly beheld a sight that filled every man on board with terror. Starting straight from the bosom of the deep, a gigantic serpent rose and wound itself twice in two mighty coils round the largest of the whales, which it proceeded to crush in genuine boa-constrictor fashion. In vain did the hapless whale struggle, lash the water into foam, and even bellow, for all its efforts were as nothing against the supernatural powers of its dreadful adversary, whose strength 'may be further imagined,' says a leader in the *Daily Telegraph*, 'from the fact that the ribs of the ill-fated fish were distinctly heard cracking one after the other with a report like that of a small cannon. Soon the struggles of the wretched whale grew fainter and fainter; its bellows ceased, and the great serpent sank with its prey beneath the surface of the ocean.'

Its total length was estimated at fifty yards, and its aspect was allowed to be simply 'terrific.' Twice again it reared its crest sixty feet out of the water, as if meditating an attack upon the *Pauline*, which bore away with all her canvas spread. Her crew told their terrible story. But critics there were who averred that what they had seen was no serpent at all, but only a bottle-nosed whale attacked by grampuses!

In a letter to the London prints concerning this affair, we have another description of our old friend the serpent, as he appeared off St David's Head, to John Abes, mate of a merchantman, in 1863. 'I was the first who saw the monster, and shouted out. A terrible-looking thing it was! Seen at a little distance in the moonlight, his two eyes appeared about the size of plates, and were very bright and sparkling.' All on board thought his length about ninety feet; but as he curled and twirled rapidly, it was a difficult matter to determine. Captain Taylor ordered him to be noosed lasso-fashion with a rope; which John Abes tells us he got on the bowsprit to throw, but in the attempt, threw himself overboard. 'The horror of my feelings at the moment I must leave you to imagine,' continues this remarkable epistle (which is dated from Totterdown, Bristol, September 19, 1875). 'The brute was then within a few yards of me, with its monstrous head and wavy body, looking ten times more terrible than it did on board the brig. I shiver even now when I think of it. Whether the noise made by throwing the ropes over to save me scared him, I cannot say; but he went down suddenly, though not more so than I came up. After a few minutes he appeared some distance from us, and then we lost him.'

When next we hear of the sea-serpent after his adventure off Cape Roque, he was beheld by the crew of no less a ship than Her Majesty's yacht the *Osborne*, the captain and officers of which, in June 1877, forwarded an official Report to the Admiralty, containing an account of the monster's appearance off the coast of Sicily on the 2d of that month. 'The time was five o'clock in the afternoon. The sea was exceptionally smooth, and the officers were provided with good telescopes. The monster had a smooth skin, devoid of scales, a bullet-shaped head, and a face like an alligator. It was of immense length, and along the back was a ridge of fins about fifteen feet in length and six feet apart.

It moved slowly, and was seen by all the ship's officers.'

This account was further supplemented by a sketch in a well-known illustrated paper, from the pencil of Lieutenant W. P. Hynes of the *Osborne*, who to the above description adds, that the fins were of irregular height, and about forty feet in extent, and 'as we were passing through the water at ten and a half knots, I could only get a view of it "end on." It was about fifteen or twenty feet broad at the shoulders, with flappers or fins that seemed to have a semi-revolving motion. 'From the top of the head to the part of the back where it became immersed, I should consider about fifty feet, and that seemed about a third of the whole length. All this part was smooth, resembling a seal.'

In the following month, the Scottish prints reported, that when the Earl of Glasgow's steam-yacht *Valetta* was cruising off Garroch Head, on the coast of Bute, with a party of ladies and gentlemen on board, an enormous fish or serpent, forty feet in length and about fifteen in diameter, suddenly rose from the sea. Under sail and steam the *Valetta* gave chase. A gentleman on board speared it with a salmon 'leister'; on which the serpent dived, and after a time reappeared with the iron part of the weapon sticking in its back. The monster scudded along for some minutes, again dived, and was not seen afterwards. There is little doubt, however, that the animal which figured in this instance was a very large basking-shark (*Selache maxima*).

An animal of exactly similar shape and dimensions was reported as being seen in the subsequent August by twelve persons in Massachusetts Bay; and soon after on three different occasions in the same quarter by the crew of a coasting vessel.

In May 1877, the 'sea-serpent' would seem to have shifted his quarters to the Indian Ocean, which it must be remarked is the habitat of the true sea-snakes. On the 21st of that month, in latitude 2° north and longitude 90° 53' east, the monster was alleged to have been seen by the crew of the barque *Georgina*, bound from Rangoon to Falmouth. It seemed to be about fifty feet long, 'gray and yellow in colour, and ten or eleven inches thick. It was on view for about twenty minutes, during which time it crossed the bow, and ultimately disappeared under the port quarter.' A second account of this affair stated, that 'for some days previously the crew had seen several smaller serpents, of from six to ten feet in length, playing about the vessel.'

Strange as all these stories seem, it is difficult to suppose they are all quite untrue, for nautical superstition apart, we have the ready testimony of various men of education and veracity. That there is only one serpentine monster in the ocean, is an idea which the great disparity in the various descriptions would seem to contradict; and certainly the most astounding aspect presented by this supposed and most ubiquitous animal, was his form and size when seen by the officers of the Queen's yacht off the coast of Sicily; though it is somewhat singular that these gentlemen made no attempt to kill or capture the mighty fish, or whatever it was they saw.

By way of conclusion to these remarks we may briefly summarise the chief facts presented by 'sea-serpent tales' as they appear under the light

of scientific criticism. There is, it must firstly be remarked, nothing in the slightest degree improbable in the idea that an ordinary species of sea-snake, belonging to a well-known group of reptiles, may undergo a gigantic development and appear as a monster serpent of the deep. The experience of comparative anatomists is decidedly in agreement with such an opinion. Largely developed individuals of almost every species of animals and plants occasionally occur. Within the past few years new species of cuttle-fishes—of dimensions compared with which the largest of hitherto known forms are mere pigmies—have been brought to light. And if huge cuttle-fishes may thus be developed, why, it may be asked, may not sea-snakes of ordinary size be elevated, through extraordinary development, to become veritable 'leviathans' of the deep? That there is a strong reason for belief in the veracity of sea-serpent tales, is supported by the consideration of the utter want of any motive for prevarication, and by the very different and varied accounts given of the monsters seen. That the appearances cannot always be explained on the supposition that lifeless objects, such as trees, sea-weed, &c. have been seen, is equally evident from the detailed nature of many of the accounts of the animals, which have been inspected from a near distance. And it may also be remarked that in some cases, in which largely developed sea-snakes themselves may not have appeared, certain fishes may have represented the reptilian inhabitants of the ocean. As Dr Andrew Wilson has insisted, a giant tape-fish viewed from a distance would personate a 'sea-serpent' in a very successful manner; and there can be no doubt that tape-fishes have occasionally been described as 'sea-serpents.'

On the whole, if we admit the probability of giant-developments of ordinary species of sea-snakes; or the existence (and why not?) of enormous species of sea-snakes and certain fishes as yet unknown to science, the solution of the sea-serpent problem is not likely to be any longer a matter of difficulty.

FROM DAWN TO SUNSET.

CHAPTER THE FIFTEENTH.

STRANGE and terrible tidings reached Enderby the day after that. As Deborah Fleming was standing in the red sunset, she saw old Jordan, in his scarlet waistcoat and shirt sleeves, running bare-headed towards her under the archway. Deborah went quietly forward to meet him, dreading and yet hoping, she knew not what.

'Master Sinclair's shot!' gasped the old man. 'Killed a-duelling!'

'Who shot him?' asked Deborah, with the blood coursing in a fierce wild tide of joy through her veins, and yet a sure foreboding of the truth. 'Who? Who?'

'Need ye ask, Mistress Deborah?' asked Jordan, shaking his gray head, and regarding her with a wild reproachful gaze. 'Why, Master Charlie. Who else?'

'But he killed him in fair fight, Jordan?' panted Deborah, with her hands pressed over her beating heart, and a loud ringing in her ears. 'No one

can blame him or touch him for that ! O Charlie, O my brother !' and she fell in a dead-faint at old Jordan's feet. He caught her up, and bore her in to Marjory ; with anxious earnest tenderness they cared for her. But Deborah was soon herself. Rousing, she saw the two old sorrowful faces ; and with a hand on a shoulder of each ancient lover, burst into a wild laugh of joy. 'Free ! free !' she cried. 'Free to act and think, and laugh and weep ! Charlie has set me free ! The old man is dead ! Oh, poor sad old man, *whither has fled his soul* ?—Jordan, is Charlie hurt ? Tell me truly ; is my poor, sweet, gallant, faithful Charlie hurt ?' And she sat up, erect and resolute.

'No, no, my lamb ; he ain't hurt ; he's safe enow ; only he must be off for a time out o' this. Master Charlie has done for the "old fox," Mistress Deborah !' and Jordan began to chuckle triumphantly. Deborah laughed too, aloud. Marjory looked on scared and scandalised.

'Oh, am I mad ?' quoth Deborah, as she started up and began to pace the stone hall like a wild creature. 'Am I mad, that I care not for bloodshed, or that old man's hereafter, or anything, so long as I get freedom ? Free ! free !' she cried aloud in ecstasy, as she ran from one window to another laughing wildly ; and then, while the two old servants stood half-aghast, she sped away into the open air, into the sun—and liberty ! There, alone, on the green turf, under the waving trees, under the blue and boundless sky ; where chased the little white clouds like winged spirits ; while through all the beautiful demesne, where the birds were singing melodiously, and all nature was glad, Deborah Fleming wept her wild heart calm.

But Mistress Fleming ? Young Mistress Margaret Fleming ? She shed not a tear that day. With a heart relieved of a mighty weight, yet overcharged with anxiety, love, and fear, she watched till darkness fell, ever thinking of Deborah's wild and radiant face, till, late on in the night, or rather early morning, tidings were sent her of her love.

And where was Charlie Fleming then ? Far, far away—hunted by the dogs of vengeance and the law. Mounted on his good bay horse, he passed through Enderby that night, in his wild flight ; and as he fled, looked back, with hand uplifted to the high dim lights of Enderby, and bade it—a long adieu. Turrets, towers, and trees passed from him, like shadows in a dream. . . .

Deborah's trials were not ended. Where was her poor unhappy father ? Gone, gone again, ere she knew of it ; and she was terribly anxious about him—as to how he would take this news ; terribly anxious too, now that reason and calmness had returned to her, about her exiled brother, though Mistress Margaret had told her that he was safe out of England. Thoughts, wild and vague too, of her lover and kinsman haunted her. Where was he ? She had enough to drive her distraught ; but Deborah possessed a bold heart and iron will, and would not be subdued ; and

ever the glorious sense of recovered freedom made her heart throb with ecstasy of joy.

Some days after the duel at Lincoln, while Deborah was restlessly pacing the great lonely saloon, the outer bell rang. What now ? Tidings good or evil ? She felt prepared for anything that might befall. Old Marjory came to the door.

'Master Parry, Mistress Deborah,' and a small thin wizened man entered, with a bag in his hand. Deborah Fleming, from her stately height, looked down on the sly crafty face and shrinking figure, and with a woman's swift instinctive judgment, disliked and distrusted him. She bowed, ever so slightly. He, the cunning man of law and of the world, was half abashed and wholly uneasy at the full gaze bent upon him, and at the girl's bold and easy bearing. She waited for him to speak.

'Mistress Fleming,' he said with a low bow, 'at this sad time I must humbly apologise for this intrusion. I would have spoken with Sir Vincent ; but he is away, I find. May I venture then to address his daughter in his stead ? For my business, Mistress Fleming, is with you.'

'Certainly. Sit down, Master Parry, and say what you have to say.'

With another low bow he drew up a chair, and placing his hat on the table, and glancing first at the closed door, said in a mysterious tone : 'I come to you, Mistress Fleming, as the bearer of two great good pieces of intelligence ; one, I am sure will afford Mistress Fleming's generous heart great joy, and that I will reserve till last.'

Deborah bowed in silence ; her instinctive thoughts uttered 'Hypocrite !'

'Mistress Fleming,' continued the lawyer, still uneasy under that steady gaze, but still overflowing with polite urbanity and humble deference, 'I, as the sole executor of the late Adam Sinclair' (and his countenance lengthened visibly and his eyelids fell), 'have the pleasure of informing you that "Deborah Fleming" is left by his will the sole inheritor of all his property, landed and personal, unconditionally and without reserve.'

There was silence for a moment ; Deborah had started and then kept still and calm, while first a 'great horror of the dead man's gold, and then thoughts of her father and brother and Enderby, coursed through her startled mind. In that moment the lawyer Parry shot one furtive glance from his crafty eyes, and perceived her deep in abstracted thought ; and marvelled at her coolness and dignity, little guessing the combative thoughts that were surging in her breast.

'This was generous of Master Sinclair,' said Deborah. 'You have something else to tell me ?' She turned her eyes on him. He fidgeted ; he avoided her gaze ; he looked down, he looked out on the sky, he looked up at the carved chimney-piece, where grotesque faces grinned down at him ; he looked anywhere but at Deborah. It was but a slight tremor, a slight hesitation, only very quick eyes would have discerned it, under the flow of ready words : 'Yes, Mistress Fleming ; it relates to your brother, Master Charles Fleming ;

and though it is a proof sure and convincing that will clear him from a foul aspersion which has incidentally (*incidentally*, mind you) come to my knowledge; at the same time—and with deep reluctance I say it—it shews Master Sinclair in ill colours, and casts bitter blame on his memory. But mark, Mistress Fleming; Master Sinclair was my oldest friend, my benefactor; what I tell you now, I tell you in confidence, and the secret had best perish between your family and myself. But first I will shew what I mean.' He then drew some papers from a bag, and spread them before Deborah's eyes, with his hands upon them. 'See, see!' he muttered, apparently trembling with sudden excitement, 'what Adam Sinclair and his myrmidons have done! And to get you in his power, Mistress Fleming! All to win your favour! I swear it, for I discovered them in the act! This writing you would say is your brother's? There too is his signature. But I hereby swear it to be a base forgery, and no more Master Fleming's writing than it is mine.' This was a plot to throw dust in Sir Vincent's eyes, and disgrace on his son's name, by proving that Master Fleming had secretly raised money on this estate.

'I know it—I know it all,' said Deborah, very white and calm. 'Cannot you tell me *who* wrote this?' And she laid her finger on her brother's name, and fixed her clear eyes upon the wrinkled crafty being before her, till they seemed to read his soul.

'I cannot inform you of that, Mistress Fleming,' he answered with sorrowful regret, and looked away, and up at the grinning faces that seemed to mock him, so that he glanced quickly away from them again.

'You are generous,' said Deborah; but a look of unutterable disdain was clouding those clear eyes with passion and with scorn. 'You will tell me thus far, but no further, not even this creature's name. Why, I would give all my new possessions, Master Parry, just to bring him to justice for this. But what is your purpose in bringing this paper to me? Am I to buy it of you, as Master Sinclair would have done, had not death taken him? I heard your name and his in connection with this matter; no other.'

Master Parry wished himself away from Enderby, and well out of it all, with a heavy purse. 'Mistress Fleming,' he said, 'what you suspect, or what charge you would bring against me, I know not. I only swear to you that I got possession of this paper by great and grievous trouble, and no small exercise of talent. The villain's name who compassed this forgery I cannot divulge; but if ye would shield the dead man's memory, save the honour of your name, and that of your father and brother, and prevent this paper for ever from seeing light—take it of me.'

'Ye do trade on it then?' said Deborah, still with those eyes and lips of ineffable disdain.

'Mistress Fleming, another trades with me,' answered the man of law, with a semblance of grave and dignified reproof and a glance of injured innocence. 'I have suffered much already in this cause, and small thanks I get. If I am not well paid therefore, this paper must go back to the owner, and he makes it public. If I am well paid, it is mine—it is yours—to burn, to do with it what you will.'

'I see now, Master Parry, why it is more con-

venient to negotiate with Mistress Fleming than with Sir Vincent. I am a woman. You can threaten me, and think to daunt me; but you shall find yourself mistaken. If ye are not this arch-villain himself, ye are playing into his hands. Why, I tell ye, girl as I am, and ignorant, I know the emptiness of your threats! To what end would this forged paper be published? What harm could it do Charles Fleming? To publish *this*—and Deborah rose with a laugh of scorn, and struck her hand upon it—'would be but to bring disgrace on him who published it—disgrace! ay, and death! My brother's innocence would be proved, and this man brought to the gallows. Now, would ye have me buy it, Master Parry? Nay, you had better not, for I would have no mercy on the author of this villainy. Destroy it! Nay; I would publish it to all the world.'

'Ah Mistress, ye know little of the world then, or of the result of such a trial. It might go hard with Master Fleming, I warn ye. But if ye will have it so, I'll e'en give this back, and let him work his will. He's not a man to be made a foe of with impunity. I sadly fear ye will rue this rash act. I might have saved you. But be it, Mistress Fleming, as you will.'

With a savage consciousness of having been worsted, nay, utterly defeated, by a young and dauntless maiden, Master Parry stood with hat and bag in hand. Mistress Fleming had read him through. He had won neither gold nor favour from the future Mistress of Lincoln, only stern defiance and proud disdain.

How he hated her, but how blandly he smiled!

'I am not afraid,' quoth haughty Mistress Fleming; and looking beyond the lawyer and over his head, she bowed him calmly to the door.

One low reverence and a muttered curse between his teeth, and the doors of Enderby closed for aye on Master Parry.

Deborah was herself then. With thoughts collected and brows lowering she threw open all the windows; then standing on the hearth, she muttered: 'He has done it himself. I am trembling now with passion—only I would not vent it on a thing so mean—though my hands ached to be at him, woman as I am! Have I acted and judged aright? Oh, I know not; I know naught o' business; I cannot abide it. But I have acted a woman's part in this; not from pity, but because it would shame me to drag the name of Fleming through such mud. Only I was fain to shew the worm what I *could* do. O King, King! where art thou? O dear father; and poor, brave, gallant, honourable Charlie! Where, where is father, that I may tell him this great good news? O my precious brother, to think we should e'er have doubted *thee*! Well-a-day! I am a rich heiress—I am a great lady; I will pay all our debts; and Enderby—Enderby is *mine*! to give away to father and to Charlie! O wretched Adam Sinclair—poor perjured soul! Would your wealth not do such untold good, I would none of it. Honour and charity together shall wipe the stains from off your gold, and make it good for use.'

Sir Vincent came home late one evening, some days after Adam Sinclair's death. Some one, some careless tongue had told him suddenly that Adam Sinclair had met his death at the hand of Charles Fleming. He stopped at the lodge, and got off his horse feebly.

'Mistress Dinnage,' said he, 'where is my boy Charlie?'

She gazed at him earnestly, then answered: 'He is gone away on a journey, Sir Vincent. He'll be home again before long.'

'Before long! Ah, he's a good boy to the old man, with all his faults, whatever they may say. Where's Adam Sinclair?'

She evaded that question. 'Come home with me,' she said tenderly; and unwonted tears lurked in the dark splendour of her eyes.

So, arm in arm, proud young Mistress Fleming and the poor broken-down master of Enderby walked slowly home.

Deborah saw them pass the window; and started forward and met them. But the glorious tidings of Charlie's unstained honour, the proud consciousness of power and position, the brightness in her eyes, and the bright colour in her cheeks, left her, on looking on her father. He stretched out his hands; there was terrible pathos in that feeble but impassioned gesture, and a sad and wandering smile replaced the light of intellect.

'Deb, little Deb! O my darling! I have been looking for thee. They told me thou wert dead! It shook me terribly. Thank God, thou'rt alive and well. And how is it with thee, my dove?'

'He is wandering,' whispered Margaret below her breath. 'We must nurse him, Mistress Deborah dear; he will soon be well.'

For Deborah, leaning her brave heart on her father's breast, was trembling like a leaf, and tears of agony were gathered in her eyes. Was that strong mind, that tender father's care, dead to her for ever? Would he never, never know the innocence of his darling, whose imagined treachery had stricken him thus? 'Father!' she cried, in piercing accents of despair, 'father! Charlie is innocent. Charlie never wrote that paper, father dear; but a bad man did it, forging Charlie's name! Charlie never, never raised money upon Enderby! He is as guiltless and as true to thee as Deborah! Dost hear me, father? Dost hear me? Dost understand?'

He smiled at her vehemence, and stroked back her hair. 'Ay; I understand thee. Charlie is a good fellow, and our own dear brave boy. Though that running off from school, Deb,' he whispered, 'was the wild blood cropping up! Ha, ha, ha! that was a mistake; eh, Deb?' and he laughed vehemently again.

'O Mistress Fleming,' said Deborah, with her hand to her brow, 'this is harder to me than all. Margaret, Margaret! what shall we do? This is death in life.—O father, dear father! dost not know me? We have stood side by side in all our troubles, and now all trouble is at an end. We are rich! and Enderby, Enderby, father, is ours! We have money, father—riches, plenty! Charlie shall come home to thee—come home and live at Enderby! O sweet father, be thyself! Be calm, love, and God will restore thee, make thee well. Father, father, I am little Deb! Be my own dear father. Be thyself. Look! better times are coming, father, for Charlie and for thee! Wild, sweet, impassioned were Deborah's words and tones and looks.

Sir Vincent Fleming raised his hand to his head, and gazed all round, and gazed at her and Margaret. 'Deb,' he said, 'I am tired, very tired of

this world, dear love. Take me home, home to thy mother and to Enderby. I must rest.'

Pale and tearless, Deborah glanced at Mistress Fleming, and led the old man to his chair by the fireside. But for Mistress Fleming, she could see no more; her eyes were blind with tears.

CHAPTER THE SIXTEENTH.

That night Charlie's secretly made wife Meg Dinnage wrote and despatched a letter to Kingston Fleming, in this wise: 'Master Kingston Fleming, we are in a sore strait. Master Sinclair is dead; ye may have heard it. Master Charles Fleming is gone away. My Lady Deb is all alone, for her poor father is helpless on our hands. As ye are kind and true, come with speed to Enderby. You will be welcome.'

That same night Mistress Fleming and Deborah conferred long together, and talked themselves light-hearted about the future. Then said Mistress Fleming: 'Let me brush your lovely long hair, Lady Deb; for soon you will have a maid for this and a maid for that. Lady o' Lincoln Castle! Oh, who would have thought on such luck! I no longer hate the poor fox who has died and left you all, but pity him from my heart. Ah, Lady Deb, I wish Master Fleming could hear o' this.'

'You know where he is hiding, Mistress Dinnage, but will not tell me.'

'Nay; I am under oath. But why should Master Fleming tell "Mistress Dinnage" his hiding-place?'

'Ye cannot blind me, Margaret; you are also a maiden; you are happy. Nay; come round to me, dear. The time has come. But my own selfish sorrows have kept me dumb hitherto. Margaret, you love him! He has spoken!' Deborah leaned back in her chair, gazing up, with her hair falling like a golden shower behind her.

Mistress Fleming, dark-haired, dark-eyed, blushing, drooped, till she saw gazed laid her head on Deborah's knees. The action was eloquent.

'And ye have kept this from me?' whispered Deborah, drawing over her. 'O Mistress Dinnage, Mistress Dinnage! but you shall be wedded now as soon as ever Lincoln tragedy is blown over, and poor Adam Sinclair's fate forgot. Meantime, what doeth Charlie, dear? Speak! I will guard the secret.'

'He has gone to fight. He has listed with the Irish to fight against England. Ye have driven me to add to your sorrows, Lady Deb; lightening my own heart to tell you this.'

'O Margaret, Margaret! what could induce him to do this mad thing? Has he really joined?'

'A week ago.'

'And a private! O Charlie Fleming, this is a sore trouble, yet no disgrace. But you thought yourself a ruined man.'

'We must pray for him, Lady Deb. Oh, night and day he is my prayer. God guard him!'

'It is well father cannot know of this,' and Deborah fell into deep thought.

'Mistress Dinnage,' said she suddenly, 'I was happy this morning: I heard from May Warriston.'

'I saw you did.'

'She told me news. Mistress Blancheflower was married a month ago at Naples to Count Mazzini. There was a very grand wedding.'

'What! Did she desert Master King Fleming then, for this foreign count?'

'Ay, she did!' said Deborah bitterly. 'I would not have believed it. And I taunted him, and called him false and a traitor, Mistress Dinnage, when he came over last and told me he was free. And now I hear that *she* threw him over so soon as the rich count appeared. Heaven forgive her! She has cost me much.'

'For naught,' added Mistress Fleming fiercely; and then Mistress Fleming thought, and laughed to herself. 'When Master King Fleming comes again,' she continued softly, 'you will not chide him *then*. No; you will be kind, for sake of those hard words. I like Master King Fleming dearly.'

'Nay,' answered Deborah, speaking coldly and blushing warmly; 'I have more to forgive than he. We both spoke hotly; but King said a hard thing of me anent my wedding Master Sinclair. We were both hot. But take my word for it, Mistress Dinnage, he will come no more to Enderby.'

'He will, and will be welcome too. He would make the Master his old self again; so father says, and I will believe it.'

'O hush, Mistress Dinnage, hush! He will come no more to Enderby, nor do we need him now.'

One long day passed; but another dawn brought Kingston Fleming. Mistress Margaret, eagerly watching from her window, saw him ride up, and was out before Marjory. As she stood in the early sun, he wondered at her beauty, though his soul was in another's. She held his horse; he wondered at her graciousness, little wotting that the girl's proud heart was all subdued by the same subtle shaft that quivered in his own. She thought of herself no more.

'Thank ye,' said Kingston. 'And thank ye, dear Mistress Dinnage, for the little letter. Did Deborah know of that?'

'Nay; I writ without her knowledge. But she will welcome ye. Only try.'

'O Mistress Dinnage, I was hard and brutal with her.'

'She has forgot. Only try.'

'Where is she? And the poor old master?'

'They are in the house. I will run to him; and Lady Deb shall go into the garden, unwitting you are here. It is best so. Go round.'

'But stay, Mistress Dinnage, one moment. Where is Charlie Fleming?'

'How can I tell you?' replied Mistress Margaret with her old hauteur. 'His sister would better know; and turned away, as the scarlet blood dyed face and throat and hands.'

So Kingston sauntered round, just as if his heart were not knocking against his side with tumultuous love and desperate longing hope.

There soon walked his sweet love into the garden. Little did Kingston, there watching through the trees, know of the great fortune that had befallen her, or he would have seen himself far enough away before seeking Deborah Fleming's ear. Hark! she is singing. She is passing close to him while she sings, his first—last—only love! She was looking pale and sorrowful, that sweet Rose of Enderby. O to pluck that fair Rose from the thorny stem of Enderby, and wear it for ever on his breast! As he gazed, Kingston Fleming felt himself capable of anything for her dear sake. His heart swelled with joy and triumph, to think that she was poor and lonely, and that *he* could hew a place for her amongst the great ones of

the earth. He stepped forward, and faltered—'Deborah!'

Deborah was taken aback. She stood, and first faded to a white rose and then flushed to a red, and not a word to say.

'Deborah,' said Kingston Fleming, 'don't resent my coming. I heard of my uncle Vincent's illness—and, of Master Sinclair's death. Love! I will not offend by word or look or deed; only bid me serve thee!'

'And hast forgiven me, Kingston?' faltered the girl, her passionate love pleading wildly within her breast, and quelling all else beside, forgetting utterly that she too had thought herself aggrieved.

'Forgiven thee, Deb?' asked Kingston, paling. 'Hast thou forgiven *me*? I did thee grievous wrong; I knew my words were base and false, my noble one!'

'Ah, speak not of that, for heaven's sake! We were mad, King, and both maybe have been to blame in our past lives. We know all now; there is no secret between us.'

'No. If I know of Master Sinclair's death, you know of Mistress Blancheflower's wedding.'

'Dost know *all*, King?' asked Deborah suddenly, and tears and laughter were lurking in her up-raised eyes.

'Nay; what more? Naught will surprise me.'

'Charlie has cut himself off from England, and enlisted with the Irish rebels. Master Sinclair, little knowing my brother would kill him, has left me all his wealth and lands.'

Kingston started; he had frowned at the first tidings, but the last overclouded his brow like night. 'I knew naught of all this,' he answered calmly.

'Yes, King,' continued Mistress Fleming, with her old gaiety, 'I am a great lady now! It seems so strange for poor Deborah Fleming to be an heiress. But bethink ye: this will save Charlie; we will have him back soon!'

'Ay; it will save Charlie,' muttered Kingston thoughtfully.

'Why, you are not glad at my good fortune! Father, dear father, when he is himself, will be right glad to hear it. King, you once told me you would be proud of me if I were a grand lady. Now, ye have not a word o' congratulation to offer me, though I am Lady of Lincoln!'

'I wish ye were aught else. Deb, I would ye were a beggar!'

'O loving wish! I have been beggar long enough. Why dost wish this? Tell me.'

'Because it is Adam Sinclair's gold; because ye owe all to *him*. But Deb, I must bid ye adieu, love, when I have seen your father. I came but for a few hours; I have business at Granta.'

'Always going! always gone! King, ye are like a wreath of smoke—ever evanishing in thin air.'

He wrung her hand, and turned away; yet he saw that tears were in her eyes. Deborah felt that if he went, he went for ever. The truth flashed upon her: he loved her still, but her fortune sundered them in his eyes. What should she do? Woo him? He knew not even of her love. She plucked a daisy from the grass, and gave it him: 'King, rememberest thou? "He loved me *not*?"'

'Who loved thee not?' And he stood and gazed upon her.

Trembling like an aspen leaf at her own bold-

ness, she answered tremulously: 'Why, Kingston Fleming.'

'Didst love Kingston Fleming then?'

'Then—now—and always!' And she sank upon his breast.

(To be concluded next month.)

SKETCHES IN VANCOUVER ISLAND.

VANCOUVER Island, which forms part of British North America, and stretches a length of three hundred miles along the coast of the Pacific, is still little known, although singularly attractive for its picturesque beauty, its fine climate, and its many interesting objects in natural history. The writer of this happened to be a resident in that beautiful island in 1876, and is able to say something of its scenery and products.

We were particularly struck with the grandeur of the forests. The huge dimensions of some of the trees fill one with amazement; nor is there less surprise at the profusion of gem-like berries of many varieties. The moist alluvial soil produces the delicious salmon-berry, in appearance a glowing jewel of gold; these, with cranberries, bramble-berries, currants, and a small black gooseberry, are very abundant. The most arid and rocky situations are often fairly black with grape-like bunches of the sweet sellal berry, which grows on a low hardy evergreen, and defies frosts until late in the season. Another variety of the gooseberry, larger than the black ones, with a skin covered with a bitter and glutinous secretion, grows very abundantly on the dryer soils. Its pulp when ripe is similar to cultivated varieties. The red huckleberry, strawberry, and raspberry, with some others, abound in the gravelly pine-lands. Man's constant need of timber is abundantly met in these forests. The Douglas or red fir, a tough dense wood, attains a great size, and prevails almost universally. The red cedar, hemlock, spruce, white pine, balsam pine, and other useful conifers, are plentiful; while among deciduous trees may be mentioned maples, beeches, cherries, and oaks, which are more sparsely distributed.

To the lover of natural scenery few things are more delightful than a canoe cruise along this coast and among the intricate avenue-like channels which surround the adjacent islands. The rocky shores, mostly of a sandstone formation, are for miles wrought and carved by ocean tides and sands until they resemble fantastic Gothic architecture. The lofty snow-clad peaks of the neighbouring continent afford a sublime background to the clear azure sea and verdant graces of the nearer coasts, whose inviting bays and tiny coves seem to bid the voyager to land and explore.

Both Siwash and Cloochman, as the males and females of Vancouver Island are respectively styled, ply the paddle and sail with great dexterity. Canoeing is their forte. Many families spend more than half their lives on the water, travelling immense distances, and boldly crossing wide straits in seas that are often boisterous. Most picturesque in its details is an Indian encampment, as seen every day in the vicinity of Nanaino, Comet, and other settlements on the eastern coast. The capacious canoe is hauled beyond reach of tides, and if in sunny weather, carefully shaded, to prevent cracking. Everything needed for use is removed to the camping-ground.

A few poles and rush-mats form the necessary shelter. In making the mats the squaws (women) are very skilful, and form an ever-present and prominent adjunct to the Indian household. If the family have just returned from a successful hunt, they will probably have four or five deer to skin and dress; besides a dozen or two of grouse, a few ducks and geese; and often a seal, or elk, or black bear adds variety to the bill of fare. The skins of the animals are stretched, dried, and sold, together with such superfluous meat as can be disposed of. Two or three small wolfish dogs are generally to be seen tied up and eyeing the butchering operations with keen interest. Towards evening, presuming the necessary tasks have been accomplished, men women and children recline lazily upon their mats, and for hours make the night hideous with their peculiar clucking language.

Besides the substantial supplies already enumerated, Ocean furnishes with no niggardly hand his gleaming luxuries, of which the salmon forms the chief. In a fragile bark which holds but one, and can be lifted with one hand, Siwash or Cloochman starts for the salmon-grounds, often a mile or two from the village. Trolling a line of about twenty yards with a spoon bait or natural fish attached, he or she paddles at a moderate pace, carefully avoiding entanglement with sea-weed. The line being held with the paddle, each stroke of the latter gives the bait a spasmodic and life-like movement, highly conducive to success. Many salmon (of inferior quality) are taken in the rivers by spearing; and though the river-banks are frequently offensive from the number of fish that have died from injuries received in ascending to and returning from the spawning-ground, hungry bears and sea-fowl innumerable perform the scavenger's cleanly offices.

The natives have a peculiar mode of catching a small fish which resembles a herring, but is inferior to it in size. Taking a lath-like stick of tough wood, the edge of the end not handled being armed for several feet with thin iron spikes, they proceed slowly in search of their prey, using their implement like a paddle, and darting it rapidly through the finny droves. By this manœuvre a dozen or two are frequently impaled at a stroke, and adroitly transferred to the canoe to be used as bait. Herring and herring-spawn are largely eaten, both fresh and dried, the spawn being obtained by placing fir branches in the quiet bays which the herring frequent. As soon as the branches are covered, the spawn is collected and dried in the sun. Halibut and rock-cod are also caught in these waters. Among shell-fish may be mentioned a poor apology for the oyster, which seldom attains a diameter exceeding an inch. Its near neighbour the clam atones for this deficiency, and is frequently got upwards of a pound in weight. Very dear to the heart of Siwash is this mud-loving crustacean, which plays an active part in rustic repasts. The bivalve is often smoked, dried, and put on long skewers; and together with dried salmon, forms an unfailing adjunct to the Indian cuisine. Besides the oyster and clam, the mussel, razor-fish, cockle, and a few others are found on these coasts.

The Vancouver Islanders are a broad-shouldered, stalwart race, though perhaps a trifle below the medium stature. On their 'reservations' a few families raise stock, grain, and potatoes.

This result, however, has not been obtained without much official encouragement. A few are employed as occasional day-labourers about the Nanaimo coal-mines, and some are employed more steadily by the miners underground. The store-keepers avail themselves of their services when they need porters. Many households also employ the women for washing, &c. A language called Chinook is learned both by whites and reds, for mutual convenience in trading and ordinary intercourse. This mixture of many tongues was introduced by the Hudson Bay Company, but can scarcely be called a classical language, being far more useful than elegant, English, French, and native dialects being among its constituent parts. Another remaining mark of Hudson Bay influence is found in the curious currency existing among these people. Probably no race has ever had so bulky a circulating medium as the ordinary blanket, which in the rude lodges of the richer chiefs is stored up by hundreds, and is everywhere acknowledged to be the token of wealth.

The squaws are cunning in the manufacture of water-tight baskets, which are used for many household purposes. Their bark canoes are also unique though simple in construction. Not only in canoe-building do the Siwash display their handicraft, but many of the villages are ornamented with grotesque carvings, apparently of heathen deities. At Comox and Nanaimo might be seen a short time ago poles two or three feet in diameter with fantastic figures carved one over the other nearly to the top. At the latter place a colossal painting of a fish resembling a salmon, though perhaps intended for a whale, confronted us as we approached the village from the water.

Weird and ghostly in appearance is the Indian burial-ground hard by this spot. Steering up towards the head of the broad Nanaimo Bay until the rising ground with its heavy forests casts darkling shadows over the waters, one sees two strange goblin-like figures, hideous with paint and ghastly protruding eyeballs, apparently keeping guard over this 'city of the dead.' By the side of each of these wooden figures are poles supporting white flags, which may be intended as emblems of that truce to evil thoughts which all humanity observes towards the dead. These simple children of Nature, like some who claim more refinement, seem sadly loath to be placed underground, many of the Indian corpses being laid upon beds and covered with blankets, while a rude wooden hut is erected around. Within reach of the dead Indian's hand is often placed a piece of tobacco; and food and water are added by loving survivors. The Methodists have laboured devotedly here, together with Episcopalians and Roman Catholics.

The aboriginal tribes of the island, now that they are being brought face to face with modern civilisation, are rapidly disappearing. Small-pox has reaped its thousands, and vice and intemperance their tens of thousands, among these and neighbouring races. In Victoria and other of the towns and settlements, one remarks the comfortable European attire of many of the Indians, particularly the younger ones, who seem to prize such apparel more than most of the Pacific tribes do. During the long winter evenings, men, women, and children will gather together in one of their capacious halls and hold their sports far into the

night. The hall, often more than one hundred feet in length and fifty broad, is brilliantly lighted and warmed by huge fires of bark or pitch pine; the fires being built on the earthen floor, three in a row on each side of the interior, and having an attendant specially detailed to look after them. Seldom more than one person dances at once. If a Siwash is performing, he is often decorated with a garland of feathers, with perhaps a panther or bear skin loosely thrown across the shoulders, and bells fastened around the ankles. His movements are agile rather than graceful, a succession of high leaps and bounds being often accompanied with dumb-show and singing, in which latter the audience join strenuously. When the broad-faced, good-humoured Cloochman (the literal meaning in Chinook of the last word is goodman!) appears in the arena, her dress is often of the usual cotton fabric, her features are daubed with paint, and her thick raven locks absurdly smothered in white downy feathers. She sometimes jingles an instrument like a tambourine, and from her movements appears deeply impressed with the motto 'Excelsior;' but alas! her vast superfluity of adipose tissue and the forces of gravity combine to extinguish her lofty aspirations. If mortal eyes could behold a well-fed duck striving earnestly for gymnastic fame, its performances would probably resemble those of our lady-friend. No conventional ideas bid her to use the toe more than the heel in dancing. Upon making careful inquiries, the spectator will discover that the performers in these dances are generally in a kind of delirium, the result of severe fasting extended over many days. Their utterances are regarded as the inspirations of the Great Spirit, and the dancers doubtless obtain a tribute of reverence from their comrades in return for their privations.

Another peculiar custom is to hold a potlatch, or free distribution of gifts, at the principal villages every summer. Potlatch in Chinook signifies 'to give,' or 'a gift.' These meetings of many tribes are the scenes of much festivity. Clad in the skins of the bear, panther, wolf, beaver, eagle, or elk, Indians represent the respective animals, imitating their peculiar cries and other characteristics with wonderful fidelity to nature. When the time arrives, the chief and principal men among the hosts proceed to distribute large supplies of blankets and muskets, the latter being often thrown into the sea and dived for. Much honour is accorded to the greatest giver, and the chiefs need to be large-hearted as well as wealthy to retain their dignity.

When the writer of this sketch left the island, its mineral wealth was very considerable, and still continues to be so. Many thousand tons of the best coal on the Pacific coast were exported every month from Nanaimo and vicinity. Other large veins known to exist, were not worked, from a lack of capital and for other reasons best known to the proprietors. The Texada iron mountain, in the Straits of Georgia, together with other metallic deposits, may in the future claim the attention they deserve. When finished, the Canadian Pacific Railway will bring the right kind of emigrants to these shores, and doubtless more extensive quantities of arable land than are now cultivated will be found in the interior, when the demand for it is increased. The present race of settlers are a hardy, hospitable class of

men, expert with the axe, daring and dexterous canoeists, and very ingenious in meeting the continual difficulties and vicissitudes of backwoods life. Keen hunters are often to be met among them, men who are so successful with the rifle that their families keep a full larder without the aid of butcher or poulterer.

An enlightened system of free schools enables the widely scattered children of this island and of the other portions of British Columbia to obtain a substantial education at the public expense; and much credit is due to the energy and ability of the school superintendent, whose task it has been to organise and perfect the present satisfactory educational arrangements. We shall be glad if these sketches help to stir up an interest concerning this beautiful and productive island.

THE ADMIRAL'S SECOND WIFE.

CHAPTER IX.—TANGLED THREADS.

THERE is another listener to the song, and every word of it falls on his heart with intense meaning. It seems to him a lamenting wail of despair wrung out from aching hearts. The Admiral has returned from an official dinner-party, and when he reaches the drawing-room door, the duet is just begun. Rather surprised, and a good deal vexed at seeing Walter Reeves so soon installed as a familiar guest at Government House, he pauses, and the words of the song fall distinctly on his ear.

In bygone days, Captain Reeves was the only one amongst all Katie's admirers who really gave him uneasiness; and if truth must be confessed, he had often felt a pang of jealousy at the great attention Walter paid her, and by his unconcealed admiration of the young lady. He had made up his mind there was an end to all that now. His wife would henceforth be far removed from such influence; and when she and Walter should chance to meet, their acquaintanceship would be strictly ceremonious.

Yet now, they have taken up the old strain, and are already deploring in doleful song the hard fortune that has divided their lives. Sir Herbert has no idea of pretence or mere acting or of singing for effect. He is true to the 'heart's core' himself, and would not deign to seem other than he is. The words come to him with terrible meaning, and rouse him to sudden awakening. Has he spoiled their lives? While he would shield his wife from every rough wind and from all that could vex and annoy, has he only been driving her to despair? The guests are all so occupied that they do not notice the Admiral at the door, nor do they see him turn away with bowed head and a weight like an added ten years pressing on his heart.

Are Laura's words proving true? Has Katie only married him for wealth and position, while her heart has been given to Walter Reeves? Is she growing weary already, and pining in her gilded chains? Terrible thoughts these! They eat into his very soul, and crush him down as he has never been crushed before. He is only thankful no one sees the storm of agony that sweeps over him, while the merry music still goes on up-stairs.

Why did he not tell Katie *then*? She would

have flown to his arms, and assured him, truthfully enough, that she has grown to love him better than any one else in the world. Pleasure-loving, thoughtless, she may be, but no thought of disloyalty to her husband has ever entered her heart. But the Admiral asks no question, gives no sign, only shrouds himself up with a proud man's reticence and reserve. Though deeply hurt and wounded, he goes on his way silently, and Katie never for a moment suspects that she is making him wretched.

The next morning Walter arrives, and all the others who are to take part in the entertainment arrive also; so the rooms are again crowded, and the rehearsal goes on with spirit. There is a sound of music and talk, of song and discussion. Peals of silvery laughter burst forth; snatches of various airs are heard; Major Dillon's voice loud and prompt; Liddy Delmere's, clear and ringing. All are excited; and Walter Reeves, from his experience on the subject, is voted by all, chief authority and general manager.

Nothing loath to bear the honour, he makes even the consequential Major play second-fiddle to him. He flirts with Liddy, while she purposely goes wrong, to be set right by him; and Katie smiles more than ever at the rapid friendship springing up between the two. It is on this scene of distracting confusion that Sir Herbert looks, as he returns home an hour earlier than usual. He glances gravely round on the busy groups, who are all talking and laughing together, and cannot understand what they are about in the broad daylight, turning the quiet matter-of-fact noonday into the revelry of night. His greeting to the guests is rather formal; there is a faint compression on his lips, a slight furrow on his brow, as he listens to the allusions and watches the proceedings. In fact the guests, his wife, and all seem to him to have gone a little out of their senses. At last the visitors decide it is time to depart, and they go off in high spirits, promising to meet again there in the evening.

Sir Herbert has all that morning been taking himself to task for his hard thoughts about Katie; but resolves to atone by paying her more devoted attention. What would he not do to win her back! No sacrifice can be too great, he thinks; so he begins by coming home an hour earlier than usual, only to find fresh annoyance and disappointment. When the guests are gone, he turns his grave inflexible face to Katie, and says: 'I came back early, my darling, on purpose to drive you to Belton Park.'

Lady Dillworth is gathering up the pen-and-ink sketches of costumes, glancing at each, and mentally considering what jewels she will use to adorn the highly ornamented stomacher of Lucy Ashton's blue dress, so she replies quickly: 'I'm sorry you fixed on this morning for a drive, Herbert, for I cannot possibly get away; I've no end of music to try over.'

'Perhaps there will be time in the afternoon then. Lady Ribson leaves Belton Park in a few days, and I promised to introduce you to her.'

'Does she return to Scotland?'

'Yes. Had she not been so old and feeble, she would have come here to call for you.'

'Oh, I am so sorry about it, Herbert; but every minute of to-day is portioned out: I've a hundred things to do.'

'Katie, I very much wish you to know Lady Ribson.'

'I know, I know; and I wish it also; but our meeting can't be to-day. Don't urge me, Herbert. This afternoon I'm to call at Madame Darcy's my dressmaker; she is to try to make some wonderful medieval robes for me.'

'Surely you are not thinking of having a fancy ball here?'

'No, no; only a charade party. But we are all to appear in apropos costume. There! that's the luncheon bell.—Liddy, are you ready?'

Miss Delmere has wandered off to the music-room, and has not heard the matrimonial conversation. She comes out radiant and gleeful, a smile on her lip, as she thinks of the pleasant morning she has passed, the pleasant evening still in prospect.

'Won't the charade party be nice, Sir Herbert? I wish you were to take a part in it.'

'Thank you, Miss Delmere; but my days of masquerading are over. Allow me to take you down to luncheon.'

He walks gravely down the broad stairs with the ladies. As far as the Admiral is concerned, the meal is a gloomy one. He eats but little himself, and joins but rarely in the conversation Liddy and his wife are keeping up. Sir Herbert does not like Miss Delmere. There is a mocking satirical manner about her, a tone of banter in her voice, an expression of raillery in her clear blue eyes, and a love of badinage in her thoughtless little heart, that he cannot understand. He can never distinguish whether she is in jest or earnest, and he is not the man to probe deeply into the character of one for whom he cares so little. He would fain see the friendship between Liddy and his wife die out; but with his morbid shrinking from interfering with his wife's plans or thwarting her wishes, he does not put his wish into words. When luncheon is over, Sir Herbert does not again allude to the proposed drive to Belton Park, and the subject appears to have passed from Katie's mind also, for when he goes out, she and Liddy decide about driving at once to Madame Darcy's.

After this, preparations for the charade party go on with great energy. Liddy is in her element, for Walter comes every day to consult and rehearse. The expensive dresses are ordered; invitations are sent out; the drop-scene is being painted by a local artist; and the erewhile solemn stately shades of Government House re-echo at all hours with unwonted strains of melody and mirth.

(To be continued.)

A LEGEND OF 'THE FORTY-FIVE.'

THE news of the expected landing of Prince Charles Edward Stuart in Scotland to attempt to recover the crown of his forefathers had reached a secluded glen, and many were the hopes and fears that animated the breasts of the Highlanders.

There dwelt in a small sheeling on the hill-side a young girl of eighteen, the only daughter of a Highlander. Her rare beauty and gentle manners had won her the admiration and approval of both young and old in the glen; many were the suitors that had sought young Flora's hand, and many were the sad hearts that had left the sheeling with the gentle yet firm refusal of the Highland

lassie. Her companion from childhood had been young Donald of the clachan. The children had grown up together from their earliest years, had wandered among the bonnie heather braes, and sat beside each other in the primitive school of the glen, for years before either had known the meaning of the word love. On stormy days, when winds were high and the blinding snow-drift swept over the glen, young Donald would wrap the pretty child in his plaid, and though only two years her senior, seemed to consider himself the guardian of the mitherless bairn.

Thus years had passed away in all the innocent attachment of childhood. When the hours for play came, these children, instead of romping with the others in the school, would wander to some sunny brae and twine the purple heather in a necklet for the fair white neck of the little Flora, or to deck the blue bonnet of young Donald. Their natures seemed formed in the same mould—calm loving natures, cheerful and sunny, yet not impulsive, nor boisterous, nor cruel. Years had fled without a cloud to darken the sky of their young existence; Flora had fulfilled the promise of her childhood, and had grown in beauty both of person and mind. Hers was the same innocent and loving nature that had nestled in childhood beneath the plaid of the young Donald, who had now grown to manhood. A finer specimen of a young Highlander could not be seen; strength, agility, comeliness, and the proud bearing which is so native to the mountaineer, were his; but the artless confidence of childhood had been usurped by the deep strong power of love, and they met with more reserve as time went on.

Flora's father was proud of his only child, who so reminded him of her mother, his first and only love, that he had laid in the grave years ago. Proud of the admiration and respect that his child met with on all hands, he reasoned with himself that it was his duty as a father to endeavour to get his daughter to make a good match, which to his idea was a wealthy one. He had liked Donald, and encouraged him when they were children in the care he took of young Flora. But Donald was a shepherd, the only son of a widowed mother; and why should any foolish feeling on the part of Flora prevent her marrying some one of the well-to-do farmers who had sought her hand?

It was a winter's night; the fire was burning brightly on the hearth; and Donald, who had been spending the evening with them, had just left, when the first shadow came over young Flora's life. Her father spoke words which went like arrows to her heart, and brought tears to her glorious eyes. Donald was forbidden to come to the house again; and the name of a wealthy man whose suit she had rejected, but who had again asked her father for her hand, was pronounced with the sternness of parental authority to be the one he had selected for her future husband.

Flora loved her father, and at first only gazed at him with a look of incredulity; but the words were repeated, harsher and more stern than formerly. The tears were gone; there was an expression in Flora's eyes, not of anger, but it spoke volumes. She rose, kissed her father's forehead, and left the room.

Long hours passed ere sleep closed the tear-dimmed eyes of young Flora. Her love, her duty to her father on one side; her deep, pure, and virgin love for young Donald on the other: hard fate to

have to choose between. But the conflict was over; her decision was made. She had been truthful as the sun from childhood; and without thinking of it perhaps, her father had asked her to swear a lie at the altar of God, in pronouncing the marriage vows to a man whom she did not even respect, when her heart, her life, her love, were given to young Donald. It could not be.

'What am I to say to Errick of the Bracken Braes, Flora?' said her father, in his most winning way, the following morning.

'Tell him, I hac nae heart to gie him, and that my heart and my hand gang thegither,' was the reply.

The Highlander swore an oath, and muttering he would have his own way, left the sheeling.

Next day was Sunday, and Donald and Flora met at the little chapel in the glen. He observed that his lassie looked sad, and was even more reserved than usual. 'Meet me at the Eagles' Cairn to-morrow, Donald, when I gang to milk the goats; ye ken the hour;' and with a smile she passed on.

At the Eagles' Cairn young Flora told her lover the stern decree her father had made. 'So ye mustna be coming again, Donald,' she said, struggling in vain to hide her emotion.

At the Eagles' Cairn there was a tableau: the distant mountains, the murmuring burn, the goats grouped around, and the collie dogs reposing amongst the heather; in the centre a youth and a maiden, his arm round her waist, her head resting on his breast. The first kiss of love had been given; their troth was plighted, and the fire-god shone on the scene.

The standard of the Stuarts had been raised, and the clans were marshalling to strike the most chivalrous blow that was ever struck on behalf of a fallen dynasty. Every sheeling was sending forth its men capable of bearing arms; and with heavy hearts, yet with all the pride of their race, the Highland wives, mothers, and sweethearts were placing the white cockade in the bonnets of their darlings. Sad was the heart of young Flora when Donald told her the news; she made his white cockade in secret, and gave it to him with a parting kiss at the Eagles' Cairn the night before that sad morning that saw all that was dear to her in this world, her father and lover, march down the glen.

Donald has asked Flora to take care of his mother, now that she would be left alone; and she had gone to live with the poor old widow, whose heart was nearly broken; but she shed not a tear as her handsome boy, arrayed in his tartan, marched away to fight for bonnie Prince Charlie.

Donald's Highland pride had felt bitterly the conduct of Flora's father, but for the sake of his heart's idol, he could not hate him. They fought side by side in the first battle at which the Highland army encountered the English forces. At a critical period of the fight, Donald beheld the stalwart form of Flora's father engaged in a hand-to-hand encounter with an English soldier; he had little doubt of the result of the contest, and the smoke that enveloped the scene hid them from his sight; as it for a moment cleared away, he saw the brave Highlander hard pressed by three of the enemy, and he rushed to his assistance. Ere he reached the scene of conflict, two of the English soldiers were lying on the ground; but in giving

the blow that felled the second, the brave Highlander had lost his footing; and before he could recover himself, the third closed with him and had him down. With a wild Highland yell, Donald sprang forward like a tiger, and buried his dirk between the shoulders of the English soldier, as he was in the act of using the prostrate Highlander's dirk, while he firmly grasped his throat with the right hand. It was the work of a moment to hurl the dead soldier off the Highlander; and Flora's father sprang to his feet, to recognise in the boy he had so harshly treated, the saviour of his life. 'Donald!' he exclaimed; but the brave boy had not waited for thanks, but hurried on to join his clan, in pursuit of the now routed and disorganised English army.

Time passed on, and Highland pride on both sides had maintained the coldness that existed between the two Highlanders. It was a lovely morning when the two armies were again drawn up in order of battle, eager for the coming fray; the wild slogan of the bagpipe, the waving plumes, and flowing tartans on the one side, and the serried ranks and scarlet uniforms of the English army on the other. Its tale has oft been told. The fight was over; the impetuous charge of the Highlanders had carried everything before it, and the English army was in full retreat.

Beside a rude couch sat young Donald, who with the exception of a sabre-cut on the shoulder, had come scathless through that day of battle and victory. Not so Flora's father; he lay mortally wounded, his handsome features pale, and his broad chest heaving. He had clasped the boy's hand in his own, and spoke with difficulty: 'Donald, forgive me,' he exclaimed. 'I am wearing away: never shall I see the bonnie glen and the sheeling, or clasp again to my breast my ain dear lassie. Tell her that my dying words were seeking forgiveness from her, from you. Tell her that in health and strength, I thought mair o' riches than her happiness. God forgive me! Tell her that you saved my life; I, the wretch that would have wrecked both your young lives for gold; I that was so harsh with you. O Donald! tell her you gladdened the dying moments of her father, and that he gave her to you, with a dying man's blessing, as freely as she gave herself.' Here a spasm convulsed his paleness, and he ceased from exhaustion. Donald sat with tear-dimmed eyes; his heart was full, and his thoughts were far away.

The dying Highlander's lips moved; his voice for a moment regained its old tone: 'Tell them in the glen that Alister died the proudest death a Highlander can die—fighting for his chief, his Prince, and Scotland.' A slight tremor over his frame, and the brave heart had ceased for ever.

We will not trace the varying fortunes of the Highland army; the sun of Culloden had set in disaster, the Prince was a wanderer, the clans routed and dispersed.

A young Highlander, pale and haggard, with his arm in a sling, was resting on a bed in the clachan; an old woman counting her beads, and a young and beautiful girl, were the only inmates of the room. The sad tale of death and defeat had been told. 'Yes, Flora,' said young Donald (for he it was); 'he gied ye to me on his death-bed. Will ye still hae me?' Young Flora's lips pressed those of the wounded soldier in reply. And Donald and Flora parted no more, till Death called one away; but the

parting was not for long—within three days Death called the other. Stalwart lads and bonnie lasses laid their parents beneath the old rowan-tree in the glen, full of years, and mourned by the country-side.

THE MONTH:

SCIENCE AND ARTS.

THE usual holiday quiet has been animated by news of the discovery that the planet Mars has two moons—that a star in the constellation Cygnus is changing into a nebula—that Mr Stanley has made his way down the Congo to the sea—that Sir William Thomson has invented a chemical indicator which when attached to a sounding-line will tell the depth without stopping the ship, and that the ancient obelisk which has been talked about from the beginning of the present century, is at last on its way from Egypt to England. And now the quiet time is over; for colleges, schools, and hospitals have begun their scientific lectures; the learned Societies are resuming their evening meetings and discussions; the Royal Society have given notice that applications for aid from the funds for promotion of science voted by parliament must be sent in before December 31; and soon the men of philosophy and science will be as busy as the men whose talk is of merchandise.

Planetary satellites are a characteristic of our solar system, and now that the able astronomers at Washington have shewn that Mars has two moons, that mythological deity ceases to be exceptional. Neither in rate of motion nor in distance from the planet is there agreement between the two; for we are informed by Mr Christie of the Greenwich Observatory, that 'the outer satellite revolves once in less than a day and a quarter, and the inner three and a quarter times in one day. The phenomena,' he continues, 'presented to an inhabitant of Mars must be very remarkable, for the outer satellite will remain above the horizon for two and a half days and nights, and the inner will rise in the west and set in the east twice in the course of the night. The lunar method of determining longitudes must be singularly easy with such a rapidly moving satellite, which is equivalent to the addition of a minute-hand to the celestial clock, which in our case has to be read by the hour-hand alone.'

Mr Christie tells us further that the two moons have been seen by observers at Greenwich, Paris, and other places; and he remarks, that if they 'have been in existence for ages, it seems strange they have not been discovered before, especially at the opposition of 1862, when Mars approached the earth as closely as this year; but it is naturally much easier to see an object that has once been found than to discover it independently. The satellites must be much smaller than any of the minor planets hitherto discovered. Can Mars have picked up a couple of very large meteorites, which have approached him closely?'

Leaving this question to the experts, we add, in passing from the subject, that the orbital velocity of one of the moons is seventy-nine miles a minute; of the other, fifty miles; and that their discovery has enabled astronomers to determine the mass of Mars, and thus settle what has been to them an important and long-standing problem.

As a reverse to this astronomical triumph, we have to record the death of Le Verrier, an astronomer pre-eminent among the astronomers of the century, with such insight and such capacity for work as have rarely been equalled. He will be known through coming ages by his theory of the motions of the planets, and the tables founded thereon; for provided with these, astronomers all over the world are enabled to carry on their work with an accuracy hitherto unapproachable, and to widen its application. France has lost one of her greatest sons, and Science one of her most distinguished elaborators; but he lives in his works, and through them will continue to guide and instruct the mariner, the astronomer, and the physicist.

Mr Stanley's exploit in turn settles an interesting geographical question, for embarking on the Lualaba, he followed that river down to the Congo, and the Congo down to the sea. Thus the drainage of the lake-region of Central Africa finds its way into the Atlantic. The voyage proved fatal to some of the party through conflict with hostile natives, and accidents among the cataracts, which on the equator impede navigation for a distance of thirteen miles. The river is described as from two to ten miles wide: it drains an area of one million four hundred thousand square miles; and now with the Congo and the Nile, Africa may claim two of the largest rivers in the world.

It often happens in dark weather that the position of a ship can be ascertained only by sounding; and when near the land, the soundings should be frequent if danger is to be avoided. But as the depth cannot be accurately measured without bringing the ship to a stand-still, the seaman is apt to prefer risk to loss of time; and the consequence is at times—a wreck. Sir William Thomson, to whom navigation is indebted for an important improvement in sounding apparatus, has recently proved by experiment that by adding thereto a chemical appliance the sounding may be taken while the ship is in motion. This appliance consists of a copper tube, attached to the lower end of the sounding wire, and inclosing a slender glass tube, and a small quantity of sulphate of iron. As the tube descends, the pressure of the water forces the sulphate into the glass tube: it leaves a stain on the glass; and according to the height of the stain, as indicated on a scale, such is the depth of the water. We are informed that this ingenious instrument has been tried on board the *Minotaur* with satisfactory proof of its 'absolute accuracy and extreme handiness.'

H.M.S. *Téméraire* is appropriately named, for she is big enough and heavy enough to do battle with any antagonist that may venture to face her in the Mediterranean, whither she is bound. The engines are 7697 horse-power. No wonder that the mighty vessel when under way pushes up a ten-foot wave at her bow! The diameter of the principal cylinders is seventy inches; of the crank shaft, twenty-two inches; from which an idea may be formed of the bulk of the ponderous mass. To reduce the weight as much as possible, wrought-iron and brass are largely used in the construction of the engines and fittings, in place of cast-iron, so that in the condensers there are more than eleven thousand brass tubes, which make up a cooling surface of fourteen thousand square feet. To assist the movements and facilitate the working of

this giant among war-ships, there are on board thirty-four small engines, thus distributed: two turning, two starting, four feed, two circulating, four fan, two bilge, one capstan, one steering, four pumping, four ashes lifters, two hydraulic gear workers, one torpedo reservoir charger, one to work the electric machine which feeds the lights on the bridge, and four others. In all this there seems something of complication; but we may hope that everything will work well even in the worst of weather, so that the ship may justify her name and the merits of her builders.

The Iron and Steel Institute held their annual meeting at Newcastle-on-Tyne, where, and in the neighbourhood, the manufactures and other mechanical operations abound in which the members take most interest. That these are mines, coking furnaces, brick-works, iron-works, and foundries, may easily be imagined. One of the papers read shewed that cast-steel could be produced without compression, and as readily as cast-iron; which if confirmed by further experiment, will prove of great value in the manufacture of heavy cannon.

In a visit to Sir William Armstrong's works at Elswick, the members saw the welding of coils for guns under the great steam-hammer, which weighs thirty tons, and falls upon an anvil of one hundred and twenty tons, with a stroke of twelve feet six inches; and yet so perfect is the hydraulic moving machinery, that it can be easily worked by one man. The four cranes too by which the ponderous masses of red-hot metal are lifted, are 'under the command of one man, who can sling them right and left, or move the load up or down just as he pleases without moving from his post.' Another example of what can be done by water was shewn at the swing-bridge across the Tyne, which has four spans of about one hundred feet each. The portion which opens weighs fifteen hundred tons. 'The hydraulic machinery for actuating it, is contained in the hollow pier which forms the pivot on which it turns. The pier is surmounted by a watch-tower, in which are the levers for opening and shutting the bridge. It takes just one minute to swing the bridge from its closed position across the river to the open one in line with the stream.'

Mechanists have pointed out that water-engines use the same amount of water when merely driving themselves (which is next to doing nothing) as when exerting their entire power. If it be true that there should be a proportion between the amount of work and the quantity of water, this, as we are informed, is provided for by Hastie and Company of Greenock in an invention by means of which an automatic lengthening or shortening of the stroke of the engine takes place, in accordance with the work to be done. No sooner does the engine become, so to speak, aware of the demand on its power, than it immediately adapts itself thereto without external assistance.

To revert to the Institute: A description was given of the coking coal-field of South Durham; it is thirteen miles long by eleven miles wide, and assists in supplying the present demand for fourteen and a half million tons of coke yearly. At one of the collieries there used to be a waste of three hundred tons of coal every week; but now by means of improved coking ovens, and intercepting the waste heat, this loss is prevented. It is found too that the large deposits of inferior coal can be utilised, by crushing, washing, and then

coking: a very important fact, for there is in all our coal-fields a large breadth of coal which has been hitherto rejected as worthless, but which will now be worked and converted into coke.

A paper was read which shews that ways are opening for the utilisation of slag: it is now converted into bricks, cement, mortar, concrete, glass, and cotton or wool. This wool is an excellent material for covering boilers and pipes to prevent waste of heat. Four million bricks have been made, which looks promising.

The *Journal* of the Institute contains descriptions of machinery with which we may fitly supplement the foregoing: At Smethwick near Birmingham, there is a screw-factory which, with its clever mechanical contrivances, is something to wonder at. All the sizes of screws used in carpentry and cabinet-making are made of iron wire chopped into lengths, and shaped in a series of self-acting machines. A blow on one end forms a head, which is speedily turned true in a revolving chuck, the nick is cut by a small circular saw, a revolving jaw then seizes the head, and the 'worm' or screw is turned in a twinkling; and in this way half a million screws an hour are produced. This seems almost incredible; but the screwing-shed alone covers nearly an acre and a half, and contains two thousand machines. These being self-acting, five or six can be kept going by one woman.

Another example from the same source shews the application of machinery to soft goods and tailoring: At a wholesale clothing establishment in Leeds, more than a thousand hands and three hundred sewing-machines are employed. The cutting-out is done by means of knife-machines driven by steam, which cut through thirty-five layers of thick or a hundred and twenty layers of thin cloth at once, the pattern being marked on the topmost piece. The pile, as is stated, is manipulated around the knife-blade, just as a block of wool is moved when being cut by a band-saw. Pressing-machines heated by gas are used in place of the old tailor's goose, and as they are worked by a treadle, the workman's hands are at liberty to guide the heated iron over the seams.

As our readers know, experiments with continuous brakes for railway trains have been made in England and America. We now learn from a published Report that similar experiments have been made in Germany, and that generally preference is given to the Westinghouse brake. All other things being equal, that must be the best brake which will stop a train within the shortest distance, and that this is done by the Westinghouse appears to be clearly established. This brake has been adopted for the state railways by the Belgian government; and that the question should be settled without delay is regarded as essential in all the countries where it has been tried. The Board of Trade in a recent Report take an unusually decided tone on this point. As the *Times* remarks: 'They not only constantly refer to continuous brakes as the great railway want of the day, but they also lay down, for the first time, the qualities which a continuous brake ought to possess. The chief of these are instantaneous action when applied either by driver or guard, automatic action, regular use in daily work, and uniformity upon different lines, so that when vehicles from one line are connected with the

trains of another the same brake-power may be available for both.' We are further informed that the Board have sent a circular to the railway companies with intimation that the sooner the requirements implied in the foregoing description are put into practice the better will it be for all concerned. There is common-sense in this: it will be read with satisfaction by all who travel by railway.

Social Science this year ventured into a high latitude, and held its Congress at Aberdeen, where the usual endeavours were made to promote health, wealth, and morality, which includes law. A paper read by Mr Caird on 'Economy and Trade,' chiefly as regards agriculture, will comfort those timid folk who are always looking for that troublesome time when all our foreign supply of 'bread-stuffs' shall be cut off. 'We grow at present,' he said, 'nearly one million acres less wheat than we did twenty years ago. We have only to revert to the acreage of 1856 to meet such a deficiency as would be caused by all Europe being shut against us. And beyond that, we possess in our immense breadth of pasture-land a never-failing resource of stored-up agricultural power, which could be at once applied to the production of corn, if from any circumstance that course became at the same time necessary and profitable.'

Mr Edwin Chadwick, a veteran among sanitary reformers, read papers on Cleanliness and Health and on 'House Accommodation,' which deserve wide diffusion and careful consideration. But it may be said of these, as well as of many other topics brought forward for discussion, that 'it is better to be in possession of a few important principles than a host of facts; then reflection and reason have elbow-room, and are not hampered and brought to a dead-lock, by cramming a disorganised mass of knowledge into the brain.'

Mr H. C. Russell, government astronomer for New South Wales, has published a descriptive, historical, and tabular account of the climate of that colony in an octavo volume of more than two hundred pages, with a map and diagrams. Although the colony is not yet a hundred years old, Mr Russell has been unable to fill up the gaps which unfortunately exist in the record of its winds and weather; but his book is interesting and valuable nevertheless. He discusses the whole range of meteorological phenomena; he tells us about the hot winds and where they come from; about thunder and hail-storms; about lakes, floods, and tides; about droughts; about the rains, and why they vary; and about the great swarms of moths which at times come in clouds and infest miles of country. In his description of the physical characteristics of New South Wales, he gives particulars which will be quite new and perhaps surprising to many readers. 'Within the colony,' he says, 'may be found all climates, from the cold of Kiandra, where the thermometer sometimes falls eight degrees below zero, and frost and snow hold everything in wintry bonds for months at a stretch, and where upwards of eight feet of snow sometimes falls in a single month, to the more than tropical heat and extreme dryness of our inland plains, where frost is never seen, and the thermometer in summer often for days together reads from one hundred to one hundred and sixteen degrees, and sometimes in hot winds reaches one hundred and thirty degrees, and

where the average annual rainfall is only twelve to thirteen inches, and sometimes *nil* for a whole year.' Clearly there is more scope than was thought for settlers who like 'bracing weather.' In discussing the observations, Mr Russell is of opinion that a periodicity, or a tendency to cycles of phenomena, is discoverable.

How to prevent famine, will be for some time to come a very serious question in India; and while charity seeks to palliate the misery, science is trying to discover the laws of the rainfall, and to devise means of storing large supplies of water against seasons of drought. Examples are not wanting. More than a thousand years ago one of the kings of Ceylon erected a tank, Kanthalai, on a scale so enormous, that were it to be built now it would cost a million sterling. This tank is to be repaired and made available for irrigation. In another district the tank of Kalowewa was twelve miles long and thirty miles in circumference, inclosed by embankments sixty feet in height, and was kept full by two rivers which flowed into it from the hills. In the district of Manaar the Giant's tank offers a further resource, and makes us aware of the pains taken by the natives to secure a sufficient water-supply in former ages. If India has not tanks enough for her wants, they must be built, for periodical famines are an opprobrium to Christian civilisation.

As regards Ceylon, we learn from an address delivered by Sir W. H. Gregory, the governor, that great improvements have been made in that fertile island: jungle and swamp have been converted into rice-fields or lakes: in Kandy there is a constant water-supply: fountains are set up in the villages: laws are in force for preservation of the forests, of the deer, buffalo, and elephant: the pearl-oyster, after some years' disappearance, has returned to the shores: a breakwater is in course of building which will convert the open roadstead of Colombo into a safe harbour, accessible to large ships at all seasons, and it is thought that in time Ceylon will become the great free port of the East.

Pitury is a stimulant said to be of marvellous power, and known to be used by the aborigines of Central Australia; but its origin has hitherto remained undiscovered. Last February, however, after vainly endeavouring for many years to obtain a specimen of the plant, Baron Ferdinand von Müller, Director of the Botanical Gardens at Melbourne, succeeded in getting some leaves; and after careful microscopic examination, he has shewn that they are derived from the *Duboisia Hopwoodii*, which he described in 1861. This bush extends from the Darling River and Barcoo to West Australia, through desert scrubs, but is of exceedingly sparse occurrence anywhere. In fixing the origin of the pitury, a wide field for further inquiry is opened up, inasmuch as a second species of *Duboisia* extends in the forest-lands from the neighbourhood of Sydney to near Cape York, and has also been traced in New Caledonia, and more recently in New Guinea. In all probability the latter shares the properties of the former, as Baron von Müller finds that they both have the same burning acrid taste. The natives of Central Australia chew the leaves of the pitury, just as the Peruvians and Chilians masticate those of the coca, to invigorate themselves during their long foot-journeys through the deserts. Baron von Müller is not

certain whether the aborigines of all districts in which the pitury grows are really aware of its stimulating power; but those living near the Barcoo travel many days' journey to obtain this, to them, precious foliage, which they always carry about with them, broken into small fragments and tied up in little bags. The blacks use the pitury to excite their courage in warfare, and a large dose has the effect of infuriating them. It is by no means improbable that experiments may shew that by this discovery a new and perhaps important medicinal plant has been gained.

A STRANGE PAIR.

ABOUT half-way between Martinsville and Liberty Corner, Pennsylvania, hidden from inquisitive eyes by tall trees and dense-growing shrubs, stands a neatly built house of ancient date; the home of a pair of lovers of a quiet life, who, the world forgetting, by the world forgot, have dwelt there in a semi-hermit way for nigh upon forty years.

Samuel and Joseph Pooley, brothers in mind as well as in blood, claim kindred on their mother's side with one of England's wealthiest nobles, and boast direct descent paternally from a follower of the Norman, who settled in Kent. In 1828 they set up in business together in New York; and in the same year Samuel, the elder of the two, coming over to England, fell in love with a beautiful girl, and wooed and won her; at least it was settled that she should become Mrs Pooley so soon as the success of the New York establishment was assured. A second visit to the old country in 1834 proved less happy in result. Samuel was not prepared to take a bride home with him; and tired of living upon hope deferred, the lady declared off; and not very long afterwards put the renewal of the engagement beyond possibility by marrying a readier suitor.

From that time Samuel Pooley became another man. The brisk man of business, the ardent politician, the lively companion, lost all liking for society, politics, and trade. His brother sympathised with his altered mood; and when, a few years later, a legacy fell to them, they resolved to retire far from the busy city and its restless crowd, and live as men whom man delighted not, nor women either.

Four thousand dollars made the Pennsylvanian homestead and its hundred and five acres their own; and there they have abided ever since, never, except when necessity compelled, finding their way even so far as the neighbouring village. Twenty years ago a sister-in-law spent a day or two at the farm; but from that time to this no woman's foot has crossed its threshold. A New York reporter describes Joseph Pooley as a ruddy-complexioned merry man, with large round wide-open eyes, a long pointed white beard, and snow-white locks bristling up nearly three inches from his scalp. Samuel, better known as 'the Squire,' is seventy-three years old—two years older than his brother, and not so stoutly built. He sports a short tuft of iron-gray beard, jutting out abruptly between his chin and throat.

As the inquisitive caller came upon the pair enjoying the cool evening air in the garden, the raggedness of their raiment struck him as something simply perfect. Joseph was arrayed in a woollen shirt (or rather enough of one to suggest what it once

had been), a considerable portion of a jacket, and a very fair representation of the leading features of a pair of pantaloons; a pair of stout shoes and a gray felt hat of no particular shape completing his costume. As to the Squire's outfit, the facilities for ventilation were even greater than those enjoyed by his brother. His skin gleamed through innumerable rips and rents, to the great convenience of the mosquitoes, which he did not seem to notice; and his black felt hat was a more antique effort of the hatter's art than the gray one decking Joseph's head.

'It is unjust to say of them,' writes the note-taking visitor, 'as some do say, that they have not washed their faces or hands for ten years; they wash themselves when they feel like doing it. But seeing them, one would not find it difficult to believe that they had not felt like it for five years. At all events, this does not seem to be their year for ablutions.'

The consumption of water at the hermitage is not calculated to cause a scarcity of that article. 'On the table were standing a number of dishes of coarse yellow and blue and white delf, which had evidently just been used for supper. They always stand there, and they always have evidently just been used. Dish-washing is looked upon as a superfluous frivolity and waste of exertion. If perchance a sudden freak takes one of the hermits, just as he is sitting down to eat, that he would like to put on a little extra style, he wipes his plate with a bunch of grass or a piece of paper. But they are men of settled habits and seldom have freaks.' These Pennsylvanian disciples of Zimmerman would be at home among the dirt-loving Eastern Christians, whose domestic arrangements lately wrung from a special correspondent the declaration, that he would rather dine off a Turkish floor than a Bulgarian plate.

Like recluses in general, the Pooleys seem to be physically none the worse for contemning cleanliness, being troubled with fewer infirmities than most men at their time of life; while, unlike the common run of solitarians, they have kept their mental faculties in working order by the constant use of a first-rate collection of books, their library counting up eight hundred volumes. Neither miserly by nature, nor compelled to be so by poverty, they are by no means anchorites; and if they do go raggedly clad, it is not from economical motives, but because they are comfortable in their tatters, and have no reason to study appearances, since those who know them care not how they are dressed; and for the opinion of those who do not know them they care nothing.

Said Joseph to the New Yorker: 'It may seem strange to you that we should exile ourselves in this way from the life of the big town, after such a busy life as ours used to be; but I assure you we see enough of life to content us here. The life of the birds, the bees, the waving branches over our heads, the flowers blooming about us, and the grass beneath our feet—all these fill our hearts with a quiet content; and here we are truly happy.' It is something to know that two men in the world have succeeded in attaining this degree of contentment, though not quite to be generally admired.

THE GAELIC NUISANCE.

It is not a very creditable fact that after centuries of national consolidation, there should be communities within the British Islands who use different vernacular tongues and are ignorant of English. In other words, there are large numbers of persons who cannot in ordinary circumstances be directly communicated with. They can neither send nor intelligibly receive letters through the post-office. Summoned as witnesses on civil or criminal trials, they are in the position of foreigners, and stand in need of interpreters. Cut off from English books and newspapers, a correct knowledge of history, of science and art, and of passing events is scarcely possible. They necessarily vegetate amidst vague legends and superstitions. There is a life of stagnation and impoverishment, in the spot where they were born; for anything like voluntary emigration to improve circumstances is only exceptional. And all this has been complacently tolerated, if not pampered, for hundreds of years by a nation full of enterprise, and which, with no injustice, aspires to be in the front rank of general civilisation.

We are quite aware that much the same thing can be said of most of the continental nations. All are a little behind in this respect. The ancient Breton language survives in France, as does the Basque in Spain. Switzerland, Germany, and Russia are respectively a jumble of spoken tongues. In Holland and Belgium, we have the Dutch, French, Flemish, and Walloon. To accommodate the inhabitants of Brussels, the names of the streets are stuck up in two languages. These continental diversities do not greatly surprise us. In frequent wars, revolutions, conquests, annexations, along with want of means, and a host of inveterate prejudices to be encountered, we have an explanation of the strange mixture of languages and dialects which still prevails in continental Europe.

The case is somewhat different in the United Kingdom, where everything but old prejudices would seem to favour a uniform native language which all can use and understand. Yet, as we

have said, there exist communities who are still less or more ignorant of English. Centuries have rolled on, and notwithstanding all appliances, groups of people are yet found speaking a language which was common a thousand years ago, but now occupies an obscure and fragmentary position. We do not say that matters have not been advancing towards uniformity. Little by little, outlying communities have been satisfactorily Anglicised, not by anything like legal compulsion, but by what might be termed a natural process of assimilation. We may speak of two important cases. In the Shetland and Orkney Islands the Norwegian language existed until within the last two centuries. It is now totally gone, and the vernacular is a pure English; vastly to the advantage of the natives, who besides being open to common civilising influences, are prepared for pushing their fortunes in any part of the British dominions; some of them indeed making no mean figure in current literature. The other case is that of Galloway, a district embracing two counties in the south-west of Scotland, where the Gaelic prevailed longest in any part of the Lowlands. 'The wild Scots of Galloway' was once a well-known phrase. It has passed away along with the Gaelic speech. The Gallowegians—abounding in men of genius—are now a lively and prosperous English-speaking and English-writing people. For them the change has been a very happy one.

With a knowledge of these two instances of social improvement, there is the more reason to regret the protracted existence of non-English speaking races. No one will say that any good has come of the continued prevalence of Erse, the old Irish tongue; nor of Manx in the Isle of Man; nor of Welsh, though that, as regards literature, is considerably ahead of any branch of the once universal Celtic tongue. Considering what spirit is demonstrated in the way of books, newspapers, and otherwise, Welsh rises to a comparatively prominent position; but there always remains the unpleasant reflection, that interesting as the Welsh tongue may be, it distinctly mars national unity, and must be a drawback on those adhering to it

alone, and reared in ignorance of English. To this cause is doubtless attributable the lingering of many whimsical superstitions in the Principality.

Should any one desire to see what mischiefs are effected by adherence to a language long since out of date, he should visit some parts of the Highlands and the Western Islands of Scotland, where, by a well-meant but mistaken policy, Gaelic is still perseveringly maintained. Some years since, it was our fortune to pay a visit to Barra, one of the Outer Hebrides; and the feeling which rose in our mind was that what we beheld was a specimen of Scotland as it existed in the sixth century, when St Columba spread a knowledge of Christianity in the western Caledonian regions. We seemed to step 'back twelve hundred years. It was a marvellous kind of look into antiquity. In their language, in their rude dwellings of stone and turf, in their religious forms, and in their dress, the people belonged to a far-back age. Their existence was an anachronism. And the curious thing was to find this condition of affairs within four-and-twenty hours of Glasgow, with its enterprise and prodigiously busy population. We have seen the Micmacs living in a way little better than dogs in the wilds of Nova Scotia, but one is not greatly astonished to see Indians dwelling in a state of primitive wretchedness. The sentiment of wonder is raised on finding natives within the British Islands still living as their ancestors did at a time coeval with Vortigern and the Saxon Heptarchy. There they are, for anything we can see, unimprovable. Speaking Gaelic and nothing else, they, in their dismal isolation, are left behind in all ordinary means of advancement. Who has not heard of the institutions plausibly and benevolently set on foot to enlighten the aborigines of the Highlands and Islands? Well, here, after all that is done, things are much as they were in the era of St Columba—people living almost like savages, without the ability to hold intercourse with strangers, or the power to improve their circumstances in consequence of knowing no other tongue than Gaelic. That language is their bane. It keeps them poor, it keeps them ignorant. So far as they are concerned, the art of printing might as well never have been invented. The intelligence communicated by books and newspapers is for them wholly unavailing. Practically, they are living hundreds of years before the ingenious discoveries of Gutenberg and Coster. To think that with all the costly apparatus of national education, such should be going on within the compass of the British Islands!

It is no use to mince a matter so grave in its results. The upholding of Gaelic as a vernacular tongue is, in our opinion, an error to be lamented and abandoned. In saying so, we are reminded that an effort has been made by an eminently enthusiastic Professor to gather funds for the purpose of endowing a Celtic Chair in the University of Edinburgh. To that effort, which is likely to prove successful, we make no special objection. Let Celtic, like any other ancient language, by all means be cultivated among the higher aims of philology. Students who like to pursue learned inquiries of this kind may do so. But it is a wholly different thing to maintain a system of elementary teaching in schools which tends to perpetuate Gaelic as a spoken tongue to the exclu-

sion of English. Apart from social intercommunication, there may be a difficulty in substituting English for Gaelic. Teaching to read English alone in Gaelic-speaking districts is said to be of little use. The pupils learn to pronounce the words without attaching any meaning to them. Impressed with this awkward consequence, the Society for the support of Gaelic schools, which has been in existence upwards of seventy years, suggests that the best way to promote a knowledge of and taste for English is to begin by teaching pupils to read Gaelic. 'The people,' it is represented, 'having once got a taste for learning, are not satisfied with their children being able to read Gaelic; a number of them pay the teacher for instructing them also in reading English and writing at extra hours.' There may be some truth in this view of the matter; but unfortunately we are confronted with the greater truth, that considerable numbers in the Highlands and Islands still speak Gaelic, and are ignorant of English to any useful purpose.

If it be absolutely necessary that schoolmasters must begin by teaching to read the Gaelic, they ought not to end there, but proceed to offer, by a close translation, the requisite knowledge of English. There are surely teachers qualified to make Gaelic-speaking children understand the meaning of English words. The trouble to be taken may be considerable, but there are few things either great or good which can be effected without trouble. We cannot doubt that Highland school-boards might find a way to make pupils understand English provided they have the will to do so. Indifference and the grudging of expense perhaps lie quite as much at the root of the difficulty as traditional prejudice. It is open to conjecture that, but for undue fostering, Gaelic would stand a fair chance of disappearing altogether from the Highlands and Islands, as it did in Galloway and elsewhere simply through the operation of natural causes.

The question, Gaelic or no Gaelic, has, we fear, been too long treated in a sentimental point of view. For example, we see it fervently argued that Highlanders should be able to understand and relish the ancient Gaelic poetry, as if an acquaintanceship with a few old songs and ballads were a primary concern in life. Poor people nailed to a sterile soil by their hereditary ignorance of English, are to be congratulated for their knowledge of some poem which the world at large never heard of, and does not care about! Happy people, to whom food, clothing, and cultured intelligence are as nothing in comparison to the enviable pleasure of singing a ditty ascribed to Fingal or some more modern and less apocryphal Celtic bard! It is gratifying to know that Highlanders themselves are a little scandalised by these and similarly absurd propositions. Sensibly, they observe that it is time to get rid of Gaelic, as being entirely out of date, and only an impediment. Two years ago, in a Glasgow newspaper, one who subscribed himself a 'Western Highlander,' took exception to the unreasonable clamour that had been got up for the maintenance of Gaelic as a spoken tongue. He says very rationally: 'We Highlanders have a language that, whatever its beauties, suffices merely for speech; a language by which we cannot acquire knowledge in art, science, history, commerce, or—if we exclude the Bible—even religion. With a poor and infertile

soil, we live alongside a people rich in every gift of nature, possessing every advantage that can insure worldly prosperity. We are debarred from all the stores of wisdom locked up in the English language. Thus heavily weighted, we cannot hope to rival our neighbours' wealth, but we can wish and strive to make the best of our opportunities. We intend to win our way if industry and thrift can do it. We can endeavour to improve our infertile soil, to attract capital to our agriculture, to establish better communication with the rest of the world. Proud as we are of the mountain and the glen, we know that we cannot live by scenic beauty alone. We are tired too of kilted glory, and of dressing and acting up to Cockney sentiment about the savage Celt. We wish to recognise and study the conditions of existence, the methods of supporting life and securing comfort. And to do all this, if our much-loved language has become an impediment rather than a gain, why, let it go. We shall remain good Highlanders regardless of any particular mode of speech. At a time when the first whisperings of prosperity are beginning to reach us, when steamers deeper and deeper laden ply to every corner of the west, when the completion of a railway will soon make Oban a great commercial centre, when comforts hitherto undreamt of are everywhere obtainable—is it right at such a time of promise to intensify our disadvantages and to make our backwardness more backward still? Shrewd remarks these, well worth taking to heart.

It cannot be ascertained from any official Reports what is the exact number of persons—men, women, and children—whose language is wholly confined to Gaelic. In the second Report of the Education Commission published in 1867, it is said to be 'probable that the population of the parishes within which Gaelic continues to be the only language which is understood by the majority of the people cannot exceed a hundred and fifty thousand; these being chiefly the parishes of the Hebrides, which are wholly insular, and the mainland parishes of the west coast of the counties of Sutherland, Ross, Inverness, and Argyle.' It is believed that since 1867, the number whose speech is limited to Gaelic has diminished through various influences, among which commercial intercourse by means of steam-vessels and otherwise has been conspicuous. We should almost aver that Hutcheson's magnificent fleet of steam-vessels, whether devoted to the carrying of goods or passengers, had done more to introduce a knowledge of English, along with conditions of prosperity, into the Hebrides than any other appliance whatsoever. In the remoter or lesser islands which are little visited by strangers, there is a corresponding backwardness. Barra we have already spoken of as still in a singularly primitive condition. At Coll, Tyree, and some other islands, the knowledge of English is also unhappily deficient. In comparatively recent times, a great change in proprietorship has come over these islands. The old families—such as the Macneils and Macleans—have mostly disappeared, and new landlords with the means and desire to improve the condition of the soil and the population, find themselves obstructed by the difficulty of holding any intelligent intercourse with the natives. The disadvantage is mutual, for on all hands the Gaelic-speaking inhabitants are unable

to make their wants and feelings known to those who wish to be their friends. A melancholy case of a rigid adherence to Gaelic, is that of the extremely remote island of St Kilda. Here, as was described a few months ago by Mr J. Sands in our pages, the natives speak Gaelic and nothing else; in Gaelic they are preached to by a minister originally from the mainland; he and his wife being the only individuals who know English. Of course the natives can hold no epistolary correspondence with the exterior world, on whose sympathy they are forced to rely. A present of English books would be valueless, for they could not read them. They could not emigrate unless accompanied by an interpreter, much after the manner of a party of travellers in the East under the guidance of a dragoman. We ask, is that a position in which any of Her Majesty's subjects should continue to be placed through the effect of custom or prejudice? Such an afflicting condition of affairs is little better than a national disgrace.

It is hard to run counter to long-cherished and in the main amiable feelings. It is hard to find fault with persons and institutions whose motives in encouraging Gaelic have been alike pious and benevolent. But circumstances oblige us to be candid in a matter so momentous to public welfare. The Gaelic language may be as copious and energetic as the Greek; it may be not less suitable for poetry than the Italian; it has strong archæological claims as a relic of the tongue which in its various forms was at one time spoken all over the British Islands, if not over all Europe; but it has survived its usefulness, and is out of place as a vernacular. In short, looking to the wants of modern society, and seeing the mischief it produces, we are—however hateful the term—warranted in characterising Gaelic as a NUISANCE, which every one should aid in removing with all reasonable speed.

W. C.

FROM DAWN TO SUNSET.

BY 'ALASTER GREME.'

IN THREE PARTS.—PART II.

CHAPTER THE SEVENTEENTH.

No one but Mistress Margaret and Marjory knew that Deborah and Kingston Fleming were betrothed. Meantime Deborah, with her love-secret folded like a flower within her heart, devoted herself to her father, and Kingston remained with them. But Deborah's presence was required at Lincoln; the tenantry were anxious to welcome the new mistress; and like a dutiful daughter, fondly hoping that the change would restore her father, she determined, by Kingston's advice, to go there at once, and to leave Enderby to undergo thorough repair. So they left the dear old place. 'What will happen,' thought Deborah Fleming, 'ere I see Enderby again?' Mistress Margaret would not leave Enderby, for certain private and sufficient reasons of her own; so she pleaded to be left behind. She was in daily expectation of receiving a secret summons to follow her husband, and her heart clung to her old father and the old place.

They arrived at Lincoln Castle in the late summer gloaming. Groups of solemn cedars were just visible, and the little melancholy bats were flitting round like spirits; the grand old ivied

keep loomed darkly before them; and beyond, under a glimmering archway, were lights and figures. Deborah shuddered; she knew not whether to weep or pray, as she laid her head on her father's shoulder, and thought of herself entering in triumph as Adam Sinclair's bride. She felt a traitor, taking Kingston there, her lover, her betrothed, even though he was going away that night; and the grim presence of Adam Sinclair pervaded all the place. The same in the gorgeous rooms, gloomy though full of brilliant lights. On one side walked her tall kinsman-lover, and on the other stalked the spectre of Adam Sinclair. Deborah shivered, and clung to Kingston's arm. She went out with him under the stars to bid him good-bye. Two tall cedars met overhead, and the night-wind just sighed amongst their branches; the night-flowers were exhaling their fragrant odours.

'Deb,' whispered Kingston, 'I have half a mind to leave thee, love! Men of rank and position would flock to woo my beautiful one. Thou'rt very young. Wait; and let me come and know thy mind hereafter. *Wait*, Deb. I speak no jest. Wert thou poor, I would make thee wed me now; but love—as thou art—I cannot. Wait, Deb; and I will exact no promise from thee.'

'Thou never didst know me, King, and never will! My love was quick to come, but it was and ever will be changeless. Dear, I have seen many men; and more than thou wott'st of have made love to me. But what are they all to thee? From childhood, *thou* hast been my love; I feel no shame to tell it thee. And wilt thou, for my poor fortune, leave me? Why, thou dost tempt me to fling it all away as dross, rather than lose thy love. King, if thou leavest me, I shall *die*! For old kin's sake, thou couldst not! Remember that we are kin near and dear! Thy father and mine were boys at Enderby, and played in the same old haunts; companions near and dear. Ah well, King as thou lovest me, promise soon to come back!'

He took her face between his hands and hesitated. Perilously dear was she to him; but oh! that golden casket in which his jewel lay—he hated it! Kingston Fleming was proud where he loved.

'If thou wilt not promise,' said Deborah, 'thou shalt not go! I shall do the wooing!—Oh, I am too bold! But my heart saith thou lovest me. Then fling this pride away. King, darling, do not break my heart!'

He was vanquished. Vows, caresses, sighs, and the lovers parted.

PART III.—NIGHT.

CHAPTER THE FIRST.

The young and beautiful Lady of Lincoln won all hearts; not that she visited any but the poor in those days; but the fame of her beauty and sweetness spread abroad even so; and the 'Rose of Enderby,' though not to be seen, was known to be brightening the stern old castle. The tall gaunt father and the beautiful girl lived in utter seclusion, except when amongst the poor—always together. Strangely enough, he never tried to wander. She never had him left alone day or night; but he never seemed happy save with Deborah. And still she watched for and prayed

for a change in him. She talked to him, waited on him, sang to him from morning till night. Out in the broad sunny court that lay between the door and the entrance-gates, Deborah and her father, and often old Marjory with them, would sit and look up the long grass avenue that stretched far away, a vista of giant trees, ever twilight, where the antlered deer would trot past, to seek fresh shade and pasturage, and where the far-away murmur of country life, the lowing of cows, the tinkle of a sheep-bell, the bark of a dog, the shout of a boy, or the cries of children at play, would be wafted to them musically.

One morning, left alone, Sir Vincent said to his child: 'Where are we, Deb?'

Often he had asked the same question before; and she answered as before: 'At Lincoln Castle, father.'

But he went on: 'Who lives here?'

'You and I, father, and I hope Charlie soon. Adam Sinclair gave us this place. Wasn't it good of him?'

'Adam Sinclair?' He looked bewildered, and shook his head. 'I know naught of him, Deb. Deb, little Deb, I was thinking of Kate Shaw. I saw her yesterday.'

'Who was she, father, dear?'

He stared at her. 'Why, your mother!'

Her heart fluttered. 'My mother! And did you see her yesterday?'

'Ay; she was walking under the trees yonder. But she looked ill, sadly ill; her hair was as white as mine. She gave me such a look!'

Deborah went and knelt by her father, and put her arms around him. 'Poor sweet father! This could not be. Thou knowest my mother died long, long ago. And was her name Kate Shaw, father?'

'Ay,' and he smiled. Wrapt and intent, his eyes seemed gazing far through and away. 'She was Kate Shaw, Deb; a gipsy lass, and beautiful as the dawn. No one like her! Such eyes, such feet, such grace! Sweet Kate! sweet Kate!'

Deborah knew that her mother's name had been Kate. She marvelled, trembled.

'I walked with her yesterday, Deb; didn't I? Yes; under the trees at Enderby; and I found she loved me. Little witch! She was hard, hard to win; so coy, so whimsical! She had a gipsy lover too. I made short work of him.'

'Didst shoot him, father?'

Sir Vincent laughed aloud, then feigned to look greatly scandalised amid his mirth. 'Shoot him? Fie, fie, Deb! Ask me not what I did, child. Why, one day she cared for him, the next for me. I could not stand it. A Fleming too! The Flemings woo maidens honourably. 'Fore heaven, I made Kate my Lady Fleming—my sweet little wife Kate! But I let her go no more to the camp. Sometimes I think she pines. She talks sometimes about her mother, in her dreams—that old hag! My wife must give up all, and cleave to me. Kate, Kate! dear love!' Then he said no more, nor did Deborah; but she marvelled at what she had heard, and what could have recalled her mother so vividly.

It happened one afternoon a few days after this and their arrival at Lincoln, Dame Marjory entered with a pale face. 'My Lady Deb, there's a poor woman round there at the gates wantin' to see thee; she is very ill. She lies there; 'tis like

she's dyin'; so Master Coleman thinks. She can't be moved away.'

'I will come,' cried Deborah. 'Send Coleman to father. I will speak to her.' Beautiful, pitiful, Deborah appeared in her long black robes to the vision of the dying woman, bending down to her. She was an old, old woman, with wild and wintry hair; death in her face, but life in her great burning eyes, and those were fixed on Deborah. Deborah started back. It was *the gipsy*! A hundred doubts and certainties rushed surging to her brain. The gipsy beckoned her nearer.

'Speak to her,' whispered old Marjory emphatically. 'Go nearer.' And then Marjory, standing by gaunt and grim, waved the other servants away.

Deborah knelt and bent her ear to the dying woman's lips. 'Girl,' said the faint voice, 'I forgive and forget! Let me die like a woman, not like a dog. I am thy mother's mother, an' I have been round day an' night to seek thee. *She* cast me off—Kate Shaw, thy mother. Because she was my Lady Fleming, she forgot her old mother. I was the dirt under her feet. Thy servants turned me off, Mistress. But take me into your grand house an' let me die in peace.'

Deborah rose to her feet, and turned like a ghost on Marjory. 'Nurse,' she whispered, 'is this my grandmother?'

'Yes, Mistress Deborah; it is true.'

Then Deborah beckoned to the men, and bid them bear the dying woman in and lay her on a bed. And then Deborah, with Marjory on the other side, sat down beside her. She seemed almost gone; the breath came labouring. But the breeze that swept in at the open windows seemed to revive her. It blew on the long white locks straggling across the brow; on those glazing eyes, so dark, sunken, piteous—eyes that burned up again, and sought Deborah's face as the embers of a dying fire flicker up and throw into the room an unexpected light.

'My girl,' she said, 'if Kate had been like *thee*! Hark! I hated, an' yet I always loved thee! *Thou'dst* ne'er ha' treated me like a dog. An', ah me! I loved her like my soul!'

'Grandmother,' answered Deborah sweetly and with a clear utterance, that pierced to the dying ears, 'my mother loved you. Only the other day I heard that great as she was, she never forgot you, even in her dreams. Day and night she thought of you; but her promise to her husband kept her from you, though she pined to see you once again. Oh, be merciful then! Forgive her! You are going now to meet again. O forgive her! that God may let ye meet in heaven!'

The great eyes stirred not from Deborah's face. 'Shall I win to heaven, lass? Speak to me o' heaven.' And Deborah described to her that beautiful place, that land glorious with promise and with bliss, that 'eye hath not seen, nor heart of man conceived.' The dying gipsy listened with her soul in her eyes. Then said she, very faintly: 'I am goin'. O Jesus, let me come! O Kate—my Kate!' Then, with wonderful sudden life and fire: 'Hi! you, my lass! Where's the boy? the rogue—"wild Charlie" they called him. Where's *he*?'

'In Ireland. Gone to fight for the Irish, grand-mother.'

She laughed exultantly. 'Why, I tell thee why

—his mother was Irish, an' he knew it. Mad boy, mad boy!'

Deborah laid her white hand on the old brown trembling hand, and smiled. She watched to see again and again a strange look of Charlie in that faded face and those large and wistful eyes. A great new-born love was flooding Deborah's heart for the dying vagrant. But death was taking the wanderer away. 'O Jesus, let me come!' Deborah heard her say again.

The fire died out; the flame sank low; the embers of life just smouldered, nothing more. . . . The fresh wind blew in vain on the wild gipsy face. She was gone.

Scarcely had Katharine Shaw been laid in her grave when Sir Vincent Fleming became very ill—so ill, that Deborah despatched a letter post-haste to Mistress Margaret Fleming, begging her to make known the fact to Charlie at once. But Mistress Fleming had started for Dublin; and this is how it befell. One morning a letter came to her. She often received such; but this one had cost her a laugh and a cry of joy. Just as she was in the perusal, old Jordan entered, and stared in wonderment at the glorious happiness of her face. 'Why, my maid,' he said, 'what hast got there? It's naught but paper, is it?'

'No, dad; but something writ upon it. Father,' she said, and rose and slid the beautiful arm around his neck, 'haven't I been a good daughter to thee? Proud and purred up with mine own conceit, the lads o' the village have always called me. But, father, "Mistress Dinnage" has been a good daughter unto thee?'

'Ay, ay, lass, thou hast! What wouldst be comin' at? What ails thee now, Mistress?'

'Why, I come to ask thy blessing on me. Don't look scared, father; no shame will ever fall on thee through Mistress Dinnage. But I will out with it, for I can never beat about the bush. Father, I am Charles Fleming's lawful wife!'

Jordan seized his child by the shoulders, and his old grotesque visage grew dignified and terribly stern in its earnestness as he almost shrieked: 'Not—not unbeknown to the Master—an' Mistress Deborah?'

'Unbeknown that we are wedded, but not that we love, father. Mistress Deborah has known and wished it long; and Sir Vincent—he has seen us twice together, father, when we were walking secretly, an' has smiled on us. Mistress Deborah has heard him say a hundred times that he would fain, if he had wealth, have for his daughter-in-law an "honest poor man's child." So father, dear father, ye must not be angered.'

'Child, child! thou 'st done wrong in keepin' it hid. Married? What—married? Honestly?'

'Ay,' was the proud answer. 'Charles Fleming and Margaret Dinnage went to Daxford Church, and were wed; we came out man and wife. Ask Master Rawdon. Father, he's in Ireland; but it's kept secret from all but Mistress Deborah. He's gone soldiering, father; and in this letter he asks me to go. Father, I am his wife!'

'Ay, an' *Jordan's daughter*, Meg,' said the old man brokenly. 'I'm a'most dazed. And thou 'rt goin' to leave the old man alone—alone!'

'Only for a little time, father—a little, little time; for soon Charlie, when all the trouble's over, will come home to Enderby. It's all arranged between Lady Deb and me. A fine home-comin'

it'll be, an' it please thee, Master Dinnage! Father, I won't go for long, dear. But o' nights, thinkin' o' Charlie, I well nigh go distraught. There is danger, father, as thou know'st! Hundreds o' men are slain. I must be *there*. I must go, dear; but I won't be long.'

'Go, go!' muttered Jordan irefully. 'Thou'dst allus the bit atween thy teeth, Mistress Dinnage; so had thy poor dear mother. Go along! I've no need o' thee; yon brave young fellow hath. Thou'lt be killed next, girl, killed, ay, an' wus than killed, at the hands o' the wild Irish. But, go, go! I don't want thee here.'

Anger, pride, and sorrow struggled fiercely in the brave old heart; but 'Mistress Dinnage' knew how to take him. 'Father,' she said, sorrowfully regarding him, with her head slightly on one side, and her hands playing nervously with her apron, in her earnest pleading, 'if thou wert newly wed, an' so parted from mother by land an' sea—an' she in trouble, needin' thee sore—thou'dst wade through fire an' water, only to win to *her*. My heart is broke in twain 'tween thee both—one half is at home with thee, an' the other gone to Charlie. Though I don't speak or cry, my heart is wounded with every man that's killed, an' trouble wears me sore. Think of mother, my father! Think when thou wert first wed, what it would be for one to part thee—think o' it, an' bid me go!'

So Mistress Margaret won the day.

OUR INDIAN PETS.

AMONG the many, many good things swept from India by the great Mutiny storm was the time-honoured order of Griffi—that is, officers under a year's service in the country. Every regiment owned one or two members, and in large stations they were usually to be found by the half-dozen. They were generally the life of the station, and in every way were our *prime* pets. What would Mrs General and Mrs Brigadier have done without their griffi to patronise and make use of in various ways, such as filling up sudden vacancies at their dinner-tables, or helping to fill their ball-rooms? Griffi invariably started Indian life with the three animals which are also included in the list of 'our Indian pets'—namely the horse or his humble representative the pony, the dog, and the monkey. No griff considered his establishment complete without these three animals; there would be a general uniformity among the monkeys; but a collection of griff horses, ponies, and dogs formed a rare aggregation of screws and curs of all sorts, sizes, and colours.

There is a peculiar charm about Indian life which is rarely seen at home, and that is the compactness and domesticity of each establishment. In each household the master, and if he is married, his wife and children, is in direct contact with his servants and his animals; all are housed near him; and the daily morning stroll leads him from the stables to the farm-yard, then to the garden, and under the tree beneath which the monkey brightens up, the dogs being in close attendance. Father and the boy are brought up to be fed under their sion, except when they generally receive a crust of bread, together. Str. chupátée (an unleavened wheaten to wander. Str. cake; the 'unleavened bread' of cr night; but he is or his wife's hands; the Deborah. And still, run of the house, and at

their stated hours have their meals under some one's eyes; while the farm-yard is under the direct charge of the mistress, who fusses about among the cows, looks after the eggs and chickens, and makes over the victims selected for the table. Then on the march we are in still closer contact with our servants and animals; for a few steps only separate us from all. Emerging from the tent, a few paces to the rear bring us to the cook's tent, and behind or beside it is that belonging to the servants. Behind them are our horses and dogs, the latter generally tied up during the day and loose at night.

So it happens that in cantonments, and more especially on the march, we are virtually monarchs of all we survey; and I well remember that in the pleasant days of my griffinage, on the occasion of my first march, I felt quite patriarchal as I sat in the tent-door with all my earthly belongings around me; the bearer (valet) and the other servants attending to their various duties, my dear Caboolie horse Tom dozing in the sunshine, my faithful setter Belle lying at my feet, and my monkeys Jacko and Moony busy with their own affairs.

And now to 'our Indian pets;' and I purpose passing some of mine in pleasant review; but in doing so I shall not record anything remarkable, or what any kind observer of animals and their habits cannot fully indorse.

One of my first purchases was a horse we called Tom, a gray, thoroughbred, thick-necked, and sturdy Caboolie, for whom I paid ninety rupees (nine pounds); and right valuable did he turn out. I bought him in 1854, rode him from one end of the presidency to the other, through the Mutiny, and up to 1866, when I pensioned him. In 1869 he was attacked by black cancer, and at length I was sorrowfully obliged to put an end to his existence, to save him from a cruel, lingering death. There was nothing about him externally different from other thoroughbred Caboolies; but being made a great pet of, his mental abilities shone more remarkably, especially under daily observation. For instance, he had a strong sense of the comic. If I spoke to him when mounted, he would turn his head as much as he could and look at me; or he would take a cake or bit of sugar-cane out of my stretched-out hand, and munch it as he went along; or if I tickled one ear with my cane, he would unmistakably present the other ear to be similarly treated. He was a great thief, and I had great difficulty in restraining him from plunder when riding through crops. He was very fond of my wife's horse Punch, and neither would be stabled apart from the other; and it was most amusing to watch their nose-rubbings across the stall partition. Much, however, as he loved Punch, he would never allow him to precede him in the walk or canter, nor would he move until the dogs had been let loose and had jumped up to his nose. He knew his name perfectly, and would trot up to me when called, from any part of the field. He carried me unflinchingly through the Mutiny until wounded, and thought nothing of our weary rides of between thirty and forty miles a night.

On one memorable occasion we were escaping from a threatened attack, and I had dismounted to look at the girths; a shot from the rear elicited

the exclamation: 'I wonder where that bullet has gone to;' and I again mounted, but had hardly gone two paces when Tom began to limp. I got off at once, and then found that the bullet had struck him just outside the off-knee, had run round under the skin, and lodged in front. I tried to cut it out then and there; but the horse was too restive, and I again mounted, but only to find the poor brute getting more and more lame. I was now well behind, and the rest of our party urged me to come on. As I still lagged, they cried out to abandon the horse, as we were being pursued. This I grudgingly did, and trudged on hurriedly to join our party; having done this, I looked back, and saw poor old Tom hobbling after me. I could not stand this, so brought him on at once. When we reached comparative safety some days after, I extracted the bullet.

I have already mentioned Punch my wife's horse. He was ridden as a charger through the battle of Gujrat in January 1849, and with his rider, had a remarkable escape from a shell, which exploded between his rider's foot and his own off-shoulder. The wound inflicted left a scar, into the hollow of which you could thrust half a fist. He was a perfect lady's horse, and quite free from vice, possessing a gentle and affectionate disposition. He was fonder of Tom than Tom was of him, and used to exhibit great anxiety when, in his opinion, his friend was longer absent from his stall than usual, his return to which was greeted by a loud neigh of welcome. I have never seen so gentle or loving a horse. He quite understood the difference between adults and children, and would allow the latter to take all kinds of liberties with him, and was perfectly aware how to behave when they mounted him, as they always did when he returned from the morning or evening ride. He was a darling horse, and like true friends, his and Tom's best qualities came out under trial. Both had suddenly to exhibit their best points when the Mutiny broke out, and both behaved nobly. When Tom was disabled, I rode Punch, and during these weary days and nights he fully understood his position; many a time had we to snatch an hour or two of sleep when we could on the bare road; I would lie down with the bridle round my arm, and he would sleep standing beside me. One morning we broke down together, and both fell asleep while progressing, being rudely awoken by finding ourselves in a large roadside bush. Poor old Punch was subject to a disorder which eventually carried him off in November 1864, in the twenty-third year of his age. Unlike Tom, he was hale and hearty to the last. Peace to the memory of these two humble and faithful friends! Several horses have subsequently been in my stables, and I might narrate something about each, did time and space allow, but none of them ever took our affections so completely as did Tom and Punch; they were our first and best equine loves.

Let me pass some of my dogs in review; and how tender are the memories which some of their names recall! Dear old Belle, an English brown and white setter, leads the way: she was too old for active service, had been left in the country by her former master, and had passed from one hand to the other, getting thinner and thinner with each change. When I got her she seemed to think a new master a matter of course, and accepted the

change without emotion; but when she saw that she had really found a permanent master and a comfortable home, then all her pent-up affection welled forth, and she seemed to feel that she could not shew enough of it. She was my constant and faithful companion in the early years of my service, and I felt her loss keenly when carried off by distemper, which on that occasion killed all my dogs. Her last acts were to lick my hand and feebly wag her tail as I bent over her prostrate form.

Belle number two comes on the scene: a small black and white spaniel, which I had as a pup. She was specially noted for an intimacy she struck up with another dog Topsy, and a cat; and the romps of the three were most amusing, but at the same time most destructive to a bed of melons they always selected for their invariable game of Hide-and-seek. The gardener protested in vain against their romps, though he allowed that Belle effectually protected the melon-bed from the jackals at night. She accompanied me in our flight in the Mutiny; but, poor little thing, was lost on the road. Topsy was a great pet; a very singular-looking little animal of a mixed breed, very peppery, full of life, and immensely affectionate. Her peculiarities were—intense antipathy to jackals, whose howl she would at once imitate if you called to her: 'Jackals, Topsy;' and the clear manner in which she articulated grand-mam—mā-ā-ā, if you interrupted her growling with your finger. She accompanied her mistress to England as a co-refugee from the Mutiny, and was made much of in consequence, returning to this country only to die prematurely, dear little Topsy.

Rosie! Rosie! Here is a small liver and white smooth terrier, very affectionate, and noted for her antipathy to musk-rats and squirrels; the former she invariably killed, and the latter she tried hard to, but rarely succeeded, as they were too agile, and always got up the nearest tree. I have had to drag her away from the foot of a palm-tree, at which she had been sitting all the morning watching a squirrel. Her first litter consisted of one pup, about which she made an immense fuss, and was inclined to resent a great liberty I took with her. I found one day a starving outcast kitten, and bringing it home, put Rosie on her side, and told her to be kind to it. The kitten ravenously seized a teat; and Rosie was very uneasy, not quite making out the animal which was draining her, and evidently suspecting it to be a squirrel. After a day or two she took to the stranger; and the kitten at once made itself quite at home; rather too much so, for she would claw at the pup most unmercifully, while it yelled complainingly, the mother not knowing what to make of the arrangement. But the tables were turned as soon as the pup got its teeth and legs; and then it fiercely maintained its rights, and there used to be regular scrimmages over a favourite teat; Rosie looking on in blank amazement, and wincing under the scratches of her strange pup. The three pulled on together in a way; and there was never much love lost among them.

My monkeys Jacko and Moony I bought as a griff at Umballah for the large sum of one rupee. They were just emerging from babyhood, and so required some care and looking after. I never taught them anything; for such education, as with dogs, always necessitates more or less

severity; but I carefully cultivated the talents they possessed. The looking-glass was always a standing joke. Either monkey would cautiously approach its image, making the usual recognition grimaces, which of course were duly returned; then it would sit close up to the glass, and now and then look sideways at the reflection; or it would put a hand behind the glass, as if feeling for the other monkey. If I seized the hand, a fight with the glass at once ensued, which I kept up with my hand, and then suddenly dropped the glass. The amazement of the monkey at the sudden disappearance of its adversary was most ludicrous to behold.

Moony was very fond of a delicacy well known in India as mango-fool. The spirit of mischief induced me one day to add a teaspoonful of spirits of wine to her daily saucer of mango-fool, and for the first and last time in my life I saw an intoxicated monkey; her antics and attempts to keep the perpendicular were most absurd. She certainly attempted to dance and clap her hands, but ultimately was obliged gradually to subside and yield to the soporific influence of the spirits. As a great treat I used occasionally to loosen both monkeys and let them scamper up a large tree. At first they appreciated my kindness and came down at call to be tied up for the night; but the sweets of liberty were too great, and they gradually began to be tardy in their descent, and at last Moony preferred to spend the night in the tree. To prevent the return of such behaviour, I bombarded Moony next day with my goolél or pellet-bow (a weapon with which in those days I was remarkably skilful), and soon brought her to my feet. Both monkeys were familiar with the goolél, for I often harmlessly tested their agility by shelling them with it; but Moony now learned for the first time the punishment it could inflict; and ever thereafter, if I merely called out (when she hesitated to descend) to the bearer: 'Goolél lao' (Pellet-bow bring), she would hurry down the tree repentant. This story savours somewhat of the American colonel and opossum; but it is strictly true.

Moony had her first young one when about fifteen months old; and the fuss she made with it, and the fierce affection she exhibited, were interesting to behold. Her babe was still at the breast when the Mutiny broke out. Among the ruffians who burned my bungalow was one who provoked her in some way or other. She attacked him at once, but was killed by one blow of a láthee (stout bamboo-staff), her young one sharing her fate. Jacko escaped in the confusion, and became a vagrant.

A native gentleman once presented me with a black gibbon (*Hylobates agilis*), called by the natives from its yell, Hookoo or Hoolook. Its tremendous teeth and unearthly yell impressed me unfavourably, and I kept it in confinement, much against my will, as it always seemed so gentle. The poor brute soon died. Some time after, when staying with a dear and congenial friend at Alipore, near Calcutta, I became acquainted with a second gibbon, which was quite tame, and allowed to be at large. We at once exchanged confidences, and the poor creature's loving affection for me became quite overpowering. So thoroughly did I trust it, that I allowed my boy of three years of age to play with her, and the

way the two rolled over on the turf was most amusing to behold. The agility of the animal was simply marvellous. I have seen it go round the large house hanging by its finger-tips to the cornice beading which went round. To run up the rain-pipes was as easy to it as a ladder would be to a man; in fact, it could go anywhere and everywhere, and so often vexed us by its depredations. It found out where my boy's milk was kept, and helped itself in this strange fashion. Its great length of arm prevented it from drinking direct from the vessel, as monkeys do, the arms always intervening between the vessel and the animal's mouth; so she was obliged to sit at some distance from the vessel, and scoop out its contents with her fingers, letting the milk drop from them into her mouth. She did not drink from the hollowed hand, but let the fingers drip the liquid into the mouth. One day the gibbon had annoyed my friend by eating some of his papers, and in the afternoon we were conversing together in his study, when suddenly it appeared, and sidled up to me. With a half-angry laugh, my friend made a gesture as if to throw a book at it, and exclaimed: 'Get out, you mischievous brute.' She accordingly got out, in her silent mysterious manner, and we went on talking. We then adjourned to the roof for a view, and I drew my friend's attention to the gibbon, which was timidly surveying us from behind a distant chimney. Playfully shaking his fist at her, we walked together to the opposite end of the roof and leaned over the parapet. Presently I saw the gibbon stealing quietly towards us along the parapet. As soon as she saw that she was observed, she boldly ran up to me, threw her long arms around me, and nestled into my breast. Could I resist such an appeal for forgiveness and protection? We were both much touched by it, and winked at many of her subsequent misdoings.

So much for our principal pets: minor ones are cats, pigeons, parrots, cockatoos, minas, squirrels, and the mongoose. I might devote an article to each of these animals; but time and space warn me to stop.

THE ADMIRAL'S SECOND WIFE.

CHAPTER X.—ONLY TWO LETTERS!

At length the day for the party arrives. A hundred or more invitations have been accepted, and much expectation and curiosity is evoked at Seabright about the coming grand entertainment. Lady Dillworth's eagerness intensifies, and doubts spring up in her mind. What if the charade should prove a failure after all? She is nervous at having to sing in character, and angry with herself for her trepidation. She even tells Walter of her cowardice; and after the last rehearsal, as he goes away, she implores him to help her as much as he possibly can.

'Do, do come early, and manage everything, for I feel as if I were going to break down in the very midst. Recollect, the whole responsibility of making it a success rests on you.'

Walter promises all she requires; but Katie is not convinced, and her doubts increase as the time draws near.

The morning of that day does not begin auspiciously. A fierce storm has been raging for many

hours. When the Admiral glances over the newspapers at breakfast, his face becomes grave as he reads down the long list of disasters and wrecks. Presently the footman hands him a letter, and then his face becomes still graver.

'Anything wrong, Herbert?' asks her Ladyship.

'A ship aground on the Short Reefs,' replies he shortly.

'O dear, how dreadful! What is the name of the ship, Sir Herbert?' asks Liddy clasping her hands, and opening her eyes very wide.

'The *Daring*; and unless they get her off at the top of spring-tide, I fear she will go to pieces on the rocks.'

The Admiral drinks his coffee quickly, and prepares to leave the room.

'Where are you going, Herbert? You haven't taken half a breakfast.'

'I can't stay, Kate; for I must give orders about sending off help to the *Daring*.'

'Are any lives lost?'

'Not so far, I'm thankful to say. I hope we shall have her aloft before long;' and he goes to the library with the letter in his hand.

Lady Dillworth is very busy that morning, and not the least of her engagements is trying on her 'Lucia' dress. Before she goes up to her dressing-room on this important business, she runs into the library to ask Sir Herbert what time he is to be home to dinner. But the room is empty. The Admiral must have been called out suddenly, for a letter, still glowing with wet ink, lies open on his desk. His wife glances at it in passing, then pauses, and bends over it closely. The words are few, written off in her husband's bold dashing hand, and the contents are evidently for her father. It is an order for the *Leo* to be despatched at once to the assistance of the unfortunate *Daring*.

Lady Dillworth stands aghast. How can the charade party get on without Captain Reeves? It will be an utter disappointment, and she will be overwhelmed with mortification and vexation in the eyes of all her guests!

'Why did Herbert fix on the *Leo*? There are numbers of other ships; any one of them would do as well. The *Leoni*, for instance,' she exclaims half aloud.

In an instant the pen is in her hand, and with an impulse that seems irresistible she adds two letters to the *Leo's* name, and is surprised to see how exactly she has imitated her husband's writing.

'Of course I must tell Herbert, and explain why I did it. What will he think of my darling?' she asks laughingly, as she returns the pen to its place.

Then she goes up-stairs, and is soon closeted with her dressmaker; and the recollection of ships and all such matters is soon banished from her memory; for the dress is an odious fit! The alterations required are legion. Madame Darcy may be clever at fashionable modern dress; but in mediæval costume she has failed utterly. Katie waits patiently while the assistant, with scissors and needle, brings the garment into wearable shape. After the woman is gone, Lady Dillworth recollects about the letter, and returns to the library to tell her husband of the change she has made in it. But the letter has vanished, and the footman meets her with a message.

'My Lady, Sir Herbert told me to say he would not be home to dinner.'

'Did your master say where he was going?'

'No, my Lady; but the groom told me he was called off to Hillview, and was to go by the twelve o'clock train; and it's half-past twelve now, my Lady.'

So there is no help for it; the explanation cannot be given now; and Katie is fain to console herself by thinking that one ship is as good as another, and it can't matter much whether the *Leo* or the *Leoni* goes off to the rescue.

The day passes quickly. When it grows dark, Katie and Liddy, still in their morning dresses, and shivering a little from the cold, find their way up to Lady Dillworth's 'boudoir'—a cosy retreat, with its bright fire and closely drawn curtains. Here are Katie's books, her writing-table, and all the odds and ends that somehow gather in work-boxes and baskets. Here are periodicals uncut, for she has not had much time for reading of late, and drawing materials which are rarely touched.

On a round table near the fire is spread a delicately pink-tinted set of tea-things; and Dresden china baskets filled with tea-cakes and short-bread give promise of a dainty little meal. Miss Delmore, in a most becoming morning dress, with a warm blue shawl round her shoulders, plunges herself into the depths of a large arm-chair, places her feet on the fender-stool, and looks up brightly out of her merry blue eyes.

'How cosy this is, Kate! I'm quite enjoying it.' She pours a supply of cream into her fragrant tea and sips with keen relish.

'I wish Herbert were here,' sighs Katie in reply.

'Is he dining at Hillview this evening?'

'I hardly know, for he left no message about that; but I rather think he will dine at Belton Park, which is only a couple of miles from Hillview.'

'Is Lady Ribson gone back to Scotland yet?'

'No; she leaves Belton Park to-morrow; and I'm so sorry I have never once seen her, for Herbert is very desirous we should know each other. I believe old Lady Ribson is his *beau idéal* of what a woman should be. She is his god-mother; and her niece Bessie was his first wife.'

'You've never had time to go to Belton Park, Katie.'

'I know that; but I'm sorry now I didn't "make time," by setting other things aside. This hateful charade business has taken up every spare minute.'

'Hateful!' echoes Liddy reproachfully.

'Perhaps that is too strong a term; but the preparations have swallowed up all my time and everything else.'

'Don't begin to croak at the last minute. I mean to enjoy myself thoroughly!' exclaims Liddy, putting her cup down for more tea. Then she asks confidentially: 'Do you think Sir Herbert altered? Captain Reeves says he never saw a man aged so much in so short a time: he thinks the Admiral looks very ill.'

Lady Dillworth starts up impatiently: 'I don't know why Captain Reeves should think any such thing. My husband is *not* ill; I have never once heard him complain.'

'Ah! his is one of those grand reserved natures that would rather suffer anything than make a moan,' says Liddy, stirring her tea calmly.

'Why did you not tell me about Herbert's looking ill before, Liddy? I declare you make me quite uneasy.'

'Oh, I daresay it's all imagination on Walter's part. I'm sorry I ever mentioned it,' Liddy replies quickly.

'You needn't regret telling me; for if there is anything the matter, I ought to know it.'

Liddy is vexed at having introduced so disquieting a subject, for Katie remains silent and thoughtful during the rest of the repast, then goes languidly up-stairs to dress for the party.

CHAPTER XL.—THE CHARADE PARTY.

The bitter storm raging over the country, and spreading woe and terror and desolation far out at sea, does not much affect the expected guests. Carriage after carriage drives in at the gates of Government House; and ere long, many eager eyes are fixed on the drop-scene, the owners of them ready to be pleased or otherwise by the coming performance. Curiosity and criticism are on the alert; some of the audience are just as much inclined to find fault as to admire. When Lady Dillworth 'comes on' she feels unaccountably agitated at seeing her 'dear friends' sitting in solemn state on rows of chairs, all ready to detect her slightest shortcomings. For the moment she feels as though she would fain dart away beyond their range of vision. But this nervousness speedily vanishes. Amidst the bursts of applause that greet her, she begins to catch somewhat of the spirit of a successful *débutante*, and her pulse throbs triumphantly. Her voice rings out in strains of pathetic melody; she forgets her qualms, her trepidation, and almost even her own identity, so carried away is she by the intensely tragic music.

During the first part, the singing goes on faultlessly, then a somewhat awkward sense of failure begins to steal over the performers. Major Dillon and Walter differ about some minor points, and the former nearly bewilders the others with his eccentric proceedings. The chorus get out of tune, and the Major reproves them so vigorously that he nearly banishes all sense of harmony out of their heads.

Liddy Delmere is much amused, and she and Walter make themselves conspicuous with ill-timed mirth. This is unfortunate, as the irate mother of the hapless 'Lucia' should be grave and dignified. But Liddy forgets her part, the words and air and everything, and only remembers Walter Reeves is beside her. Lady Dillworth calls her to order with one of her haughtiest looks.

'Liddy, Liddy! do be reasonable. Don't you see what wretched idiots we are making of ourselves? We are only bringing down ridicule on our heads.'

Then in a pause, when she is not wanted to sing, Katie slips away to a room adjoining, that has been fitted up temporarily for the performers. She lifts the window-blind, and looks out on the rather grim garden, dimly lighted up with flickering coloured lamps. Dense clumps of evergreens glitter with raindrops, and cast deep uncertain shadows on the grass. The bare branches of the beech-trees are swaying wildly in the wind, and flinging themselves about like gaunt weird arms. Above in the troubled sky, heavy masses of storm-cloud are driven rapidly past, giving glimpses now and then of an almost full moon.

'Oh, what a fearful night this must be at sea!' muses Katie, and then a sudden thudder comes

over her as her thoughts fly off to the unfortunate ship *Daring*, perhaps even now wrecked and broken up on the fatal Short Reefs.

'What have I done? what have I done?' she exclaims wildly, as like a lightning flash, a sudden revelation of the possible result of her act that morning comes before her. She has prevented the *Leo* from going to sea by altering her husband's order; her own meddling fingers have kept back the very aid that might have saved the ship. The *Leo* is at that moment safely riding at her anchor in Seabright harbour; her captain is sporting himself in delightful ease. But what about the *Daring*? Where is she?

Even now the pitiless waves may be dashing over her, even now she may be breaking up on the sharp rocks. Perhaps the storm that rages past is bearing on its wild wings the awful death-shrieks of sailors as they go down into the pitiless waters.

Ah, they may be crying for help, that never comes!—help, she has kept back from them, foolishly, wickedly kept back! Souls, precious souls, may be going to their doom, in life's full prime, with unrepented sins on their heads; and she indirectly may be the one who has hurled them to their end. These thoughts rush through Lady Dillworth's mind with a crushing force, and with a vividness that makes her heart bound, her whole frame tremble. In the howling of the wind, as it sobbs with wild violence through the trees, she fancies she hears the cries of the sailors writhing in agony amidst the surging waves. She thinks they are calling on her—accusing her, and her brain whirls and her heart beats almost to madness.

'There is sorrow on the sea; it cannot be quiet.' O God! help these poor men in their distress—lay not their death to my charge! she cries almost aloud, and then she looks up, and sees Liddy Delmere watching her with alarm.

'O Lady Dillworth! what is the matter? How pale and ill you look! Shall I call any one? Shall I get anything?'

'Be quiet, Liddy; I insist. I feel faint; but you need not proclaim the fact to the whole world.'

Katie covers her face with her hands, and stands for a minute trying to recover herself—trying—while the aggy wind howls like an avenging spirit in her ears. Presently she looks up: 'I feel better now. What do you want of me, Liddy?'

'Have you forgotten our duet comes on when this chorus is over? Are you well enough to sing?' asks Miss Delmere, as she gazes with amazement at Lady Dillworth's haggard face and startled eyes.

'O yes; I will sing. Don't be uneasy; I shall not break down.' She takes Liddy's arm, and they make their appearance on the stage just in time. Much license has been taken with the score of *Lucia di Lammermoor*—new songs and duets have been introduced, and it is one of the latter in which Katie is now required to take a part.

With a great effort she composes herself, and begins. As she goes on, her voice regains its rich fullness; no one would suppose such a tempest of agony had so lately swept over her.

While she is sustaining a rather prolonged cadence, she sees the Admiral enter the room. He stands for a minute looking at her, and listening; then he catches a glimpse of Walter

Reeves, and goes quickly towards him. Though in the middle of her duet, Katie notices the start her husband gives and the quick frown that gathers on his brow. She sees him beckon Walter aside; the heads are bowed a moment as an excited whisper passes, then they leave the room together. Ere her part is over, she sees Walter return alone, and quietly make his way among the groups of people till he gets near the stage again, and there he takes up his position. The moment Lady Dillworth is free she is at his side, questioning and eager.

'I saw Sir Herbert here a minute ago. Where is he now?'

'He went out to find your father, for he said he must see him at once. I offered to go; but Sir Herbert would not hear of that.—How splendidly you sang in that duet, Lady Dillworth! Your voice came out in perfection.'

'Why did he want to see my father?' she asks impatiently.

'Sir Herbert did not say; but something appears to have annoyed him very much. I never saw him more put out, though he gave no explanation.'

Katie changes the subject abruptly.

'Is it very stormy at sea to-night, Captain Reeves? I mean, is there any danger to ships?'

'I should think there is. We haven't had such a storm as this since last winter. Every roar of the wind only makes me congratulate myself on being in such snug quarters. There's a wonderful difference between this fairy scene, with its music and mirth and its galaxy of youth and beauty, and what one would meet with out on the wild billows to-night.—What a charming evening you have given us, Lady Dillworth!'

Katie can hardly keep herself from stamping her little foot with impatience, as she looks up at Walter's self-satisfied face, beaming with enjoyment; and then she watches the smile with which he presently bends down to whisper something to Miss Delmere. Liddy responds with a flash of her bright blue eyes, and a heightened colour springs to her cheek as she makes room for Walter beside her. Never has she looked better than on this evening; the quaint antiquated costume contrasts capitally with her fair laughing face. At last the charade comes to an end; there is a subdued murmur of applause as everybody says how cleverly it has all been done. They make wild guesses at the word, and Walter has at last to explain the secret. Lady Dillworth listens to the comments of her guests with an abstracted air; and when the last carriage drives away, she summons the footman and inquires whether Sir Herbert has returned.

Hunter is an old servant of the Admiral's, and has followed his master's fortunes in various places and homes, and was with him when the first Lady Dillworth died; so he knows his ways, and sees more than perhaps his employers give him credit for. He turns a grave face towards his mistress, as he replies: 'Yes, my Lady. Master came in just when the acting was over; and when he saw the company wasn't gone, he told me to tell your Ladyship he was very tired, and would go to bed at once, instead of going back to the drawing-room.'

'Very tired, did he say?'

'Yes, my Lady; and he looked weary-like.'

'That will do, Hunter. We want breakfast very early to-morrow morning, as Miss Delmere is going away by the first train.'

Then Katie goes up to her boudoir. The fire is still burning brightly, and the lamp is throwing a soft light through the curtained room. Still in her fancy dress, the stomacher flashing with jewels, she seats herself in the arm-chair; and there, while the warmth steals over her, she covers her face with her hands, and thinks bitterly, confusedly—the loud shrieking of the wind and the fury of the cruel storm keeping up a wild accompaniment to her musings.

She wonders what she had better do. Shall she rouse her husband from his slumbers, and tell him all, or shall she wait till events call forth a confession? Never has she felt such a poor, mean, despicable coward. She hates herself for her irresolution; and all the time her fancy pictures up the surging whirlpools, the jagged rocks, the dashing waves, the yawning gulfs, and the drowning men with their despairing eyes, ever calling for the help that does not come!

REMINISCENCES OF QUEBEC.

For the following reminiscences connected with the stay of one of the British regiments at Quebec during the winter of 1870-71, we are indebted to an officer of the garrison. He writes as follows:

Until the close of 1871, Quebec was a fortress occupied by British troops; but before the winter set in, the *Orontes* and other store-ships carried away the troops and their possessions, and the stronghold passed for ever away from the rule of Great Britain.

Quebec, the principal fortress of Canada, also known as the 'Gibraltar of the West,' is built upon the strip of land projecting into the confluence of the St Lawrence and St Charles rivers. Originally a French settlement, it afterwards became one of the colonies of Great Britain, and has continued to be so until the present date.

'There is but one Quebec, and its beautiful scenery,' remarked a valued friend to the writer, as one autumn afternoon we scanned the view from the Levis Cliffs, and watched the 'Fall fleet' preparing to depart for England ere winter had closed the St Lawrence. 'The scenic beauty of Quebec,' says an old writer, 'has been the theme of general eulogy.' The majestic appearance of Cape Diamond, surmounted by fortifications; the cupolas and minarets, like those of an eastern city, blazing and sparkling in the sun; the loveliness of the panorama, the noble river like a sheet of purest silver, in which one hundred vessels may ride with safety—the graceful meandering of the river St Charles before it finds its way into the St Lawrence; the numerous village spires scattered around; the fertile fields clothed with innumerable cottages, the abodes of a rich and moral peasantry; the distant Falls of Montmorenci; the rich park-like scenery of Levis; the lovely Isle of Orleans; and more distant still the frowning Cape Tourment, and the lofty range of purple mountains of the most picturesque forms, which bound the prospect, unite to make a *coup d'œil* which without exaggeration is scarcely to be surpassed in any part of the world.

In the winter-time there is much more leisure for the merchants than in summer, as the St

Lawrence from the end of December until the end of April is one vast ice-field, isolating Quebec from water-commerce, but giving full employment to numbers of 'ice-men' to saw out great oblong masses of clear bright ice to fill the ice-houses with this much-needed summer luxury. The ice and snow are also turned to account in the fashionable amusements of snow-shoeing, tobogganing, skating, sleigh-driving, &c. Snow-shoeing is capital exercise, but somewhat trying at the commencement; for with a pair of snow-shoes fastened to the feet, the beginner is rather apt to find himself immersed in a snow-drift, and it is a difficult matter to get upon his legs again. This pastime, however, is so well known in theory that we pass to the more favourite one of tobogganing. The toboggan or Indian sleigh—one or two thin planks neatly curled round at one end—is drawn over the snow to the top of a hill. The passengers sit down, carefully 'tucking in' all articles of dress; a slight push is given, and away glides the toboggan at the rate of from twenty to thirty miles an hour. Starting is easy enough; but to descend to the desired spot is not so easy as might appear at first sight, and requires some skill in steering; for if that important matter be unskillfully performed, the toboggan, like a boat, gets 'broadside on' to the hill, twists and turns, shooting out its passengers, who rarely escape some hard knocks. If, however, the steering is successful, the tourists have, in school-boy phrase, a 'jolly ride,' and glide along the level ground at the foot of the slope for a considerable distance. There is, of course, the bother of pulling the toboggan up to the top of the hill; but such effect has the exhilarating dryness of the atmosphere upon one's spirits, and such is the charm of the amusement, that this labour is cheerfully undertaken.

One favourite run was down the citadel glacis, through a gap in a fence and into a closed yard at the base; another, also from the glacis, but running in the direction of the Plains of Abraham. The former being the most dangerous slide, was the favourite one, and many hard blows were given and received. One young gentleman met his fate in the form of a deep cut across his knee, by being tossed out of the toboggan among some scrap-iron and old stove-pipes hidden under the snow. Much sympathy was felt for him, for the wound took a long while to heal, and prevented him tobogganing more that winter. Another gentleman coming down the slide by moonlight with two young ladies in his toboggan, in place of steering through the fence, steered into it, and his face came in contact with a post; unluckily for him, the post was the hardest, and he escaped with a broken jaw, and the ladies with more or less bruises. There was a laughable upset on another occasion. A lady, said to be at least forty (also 'fat and fair'), with a friend of the opposite sex, tempted fortune in a toboggan; but as they approached the gap above mentioned she lost her nerve, and threw herself out as the toboggan was rushing down the steepest part of the slide. In less time than the reader will take to peruse this incident, she was on her head in the snow, and her feet, incased in very black boots, in the air; she then tumbled across the slide; the toboggan with its remaining occupant flew lightly over her, and then this frisky matron and her friend rolled like a pair of frolicksome lamb-

kins to the foot of the slope, the toboggan of course arriving before them.

Skating at Quebec is chiefly carried on at the Rink, a large building about one hundred and seventy feet long and seventy wide, the earth-floor of which is flooded. The ice is carefully swept daily; and each evening the rink-keeper 'dusts' it with just enough water to fill up the cuts made in it by the skaters; so that each morning finds a fresh field of glittering smooth ice. The wooden shed does three duties—namely, keeps out the heat of spring, keeps off the snow, and keeps in the cold of winter; so that skating can often be had at the Rink and nowhere else.

The band of the Rifles often played at the Rink, which was sometimes lighted up at night by gas; and visitors to Quebec had capital opportunities of seeing its young ladies exhibit their skill in the execution of sundry intricate skating-figures. Some years ago, there was a fancy-dress ball on the Quebec rink, and we have extracted a portion of its description from one of the local papers of that date: 'The bugle sounded at nine o'clock, and the motley crowd of skaters rushed on the ice, over which they dashed in high glee, their spirits stirred to the utmost by the enlivening music and the cheering presence of hundreds of ladies and gentlemen. Over the glittering floor sped dozens of flying figures, circling, skimming, wheeling, and intermingling with a new swiftness, the bright and varied colours, the rich and grotesque costumes succeeding each other, or combining with bewildering rapidity and effect. The gentlemen, in addition to the usual characters, introduced some novelties: an owl, a monkey, a monster bottle, a tailor at work, a boy on horseback—all capital representations and by good skaters. Among the ladies were representations of "Night" and "Morning," a vivandière, a habitant's wife, and other characters that appeared to advantage. The skaters presented both a varied and brilliant appearance, their parts being well sustained as to costume and deportment, and their movements on the ice being characterised by that grace and skill of movement bred of long practice. The dances included quadrilles, waltzes, galops, &c.'

That this elegant accomplishment can be turned to use is proved by a legend of two settlers in the Far West who saved their lives by the aid of a pair of skates. One had been captured by Indians, who did not intend to let him live long; but amongst his baggage was a pair of skates. The Indians' curiosity was excited, and the white man was desired to explain their use; he led his captors to the edge of a wide lake, where the smooth ice stretched away as far as the eye could see, and put on the skates. Exciting the laughter of his captors by tumbling about in a clumsy manner, he at length contrived to get a hundred yards from them without arousing their suspicion, when he skated away as fast as he could, and finally escaped.

The other settler is said to have been skating alone one moonlight night; and while contemplating the reflection of the firmament in the clear ice, and the vast dark mass of forest surrounding the lake and stretching away in the background, he suddenly discovered, to his horror, that the adjacent bank was lined with a pack of wolves. He at once 'made tracks' for home, followed by these animals; but the skater kept ahead, and one

by one the pack tailed off; two or three of the foremost, however, kept up the chase; but when they attempted to close with the skater, by adroitly turning aside he allowed them to pass him. And after a few unsuccessful and vicious attempts on the part of the wolves, he succeeded in reaching his log-hut in safety.

The cold during the winter of 1870-71 was often extreme, the thermometer ranging as low as forty degrees below zero. Upon two days the writer had the pleasure of witnessing the beautiful phenomenon called silver-thaw—that is, the trees and shrubs encircled with ice-crystal, the glitter of which on the twigs and branches in the sunlight is wonderfully beautiful. Occasionally the St Lawrence is entirely frozen over opposite Quebec, and ice boats (on skates) are popular, and the bark glides along at a pace that depends upon the wind and quantity of sail carried. Sleighing was much in fashion; and it is agreeable enough rushing through the extremely cold but dry atmosphere with a pretty young lady nestling against you as you fly along the noiseless track to the music of the sleigh bells, which the law requires each horse to carry on its harness.

Practical jokes are not unknown at Quebec, and several silly ones without wit or purpose were perpetrated that winter; but one of a special and decidedly original character played upon the Control Department, may be worth recording. The Control Department—at the head of which was Deputy-Controller Martindale—was intrusted with the providing of fuel, food, ammunition, bedding, transport, &c. for the British troops, and for some reason or another that branch of the department at Quebec is said to have been somewhat unpopular in the garrison.

On the 23d and 24th February the following advertisement appeared in the columns of the principal French paper, *L'Événement*:* 'CHATS! CHATS! CHATS! 50 CHATS sont demandés pour donner la chasse aux Rats et Souris qui infestent les Magasins du Gouvernement. Toute personne qui apportera un Chat au Bureau du Député-Contrôleur Martindale, entre 11 heures et midi un jour quelconque jusqu'au 28 du courant, recevra en retour un Dollar (1 \$) par Chat.—Par ordre,

D. C. MARTINDALE, *Député-Contrôleur*.

QUEBEC, 23 Fév. 1871—3f.

The powers of advertising were in this instance wonderfully exemplified, for at least eight hundred cats were duly brought to the Bureau; but the unfortunate cat-merchants did not receive a dollar. Some, being of a speculative turn, had bought up a number of their neighbours' cats at prices varying between ten cents and twenty-five cents each; and what with the ire of the cat-merchants at the hoax, the astonishment and indignation of the Control officers, and the caterwauling of the pussies brought in boxes, baskets, bags, &c., the scene was one which will long be remembered in Quebec. On Sunday, 26th February (according to a local custom of treating *government advertisements*), the

doors of the churches in the country districts round Quebec had the 'cat advertisement' duly posted up, so that on Monday the 27th a bountiful supply of mousers was brought from suburban districts to complete the Control catastrophe.

Of course very strict inquiries were made, with a view of ascertaining the author of the hoax; but that individual has not yet presented himself to public notice, and judiciously made use of the post-office to carry the letter to the *Événement* respecting the insertion of the advertisement. We also understand the editor of the *Événement* was politely requested to render his account for the advertisements to the Control Department. There is, we believe, an old proverb, 'A cat may look at a king;' but many of the inhabitants of the Quebec suburbs did not like to look at cats for some time afterwards.

FRENCH FISHER-FOLK.

THEY live by themselves and to themselves, these French fisher-folk; an amphibious race, as completely cut off from the shore-staying population as any caste of Hindustan. The quaint village that they inhabit consists of half a score of steep and narrow lanes, and as many airless courts or alleys, clinging to the cliff as limpets anchor to a rock, and topped by the weather-beaten spire of a church, dedicated of course to St Peter. Hard by there may be a town rich and populous; but its wide streets and display of plate-glass are not envied by the piscatorial clan outside. They have shops of their own, where sails and shawls, ropes and ornaments, high surf-boots and gaudy gown-pieces, jostle one another in picturesque profusion. From the upper windows of the private dwellings project gaffs and booms, whence dangle, for drying purposes, wet suits of dark-blue pilot cloth and dripping pea-coats. Everywhere prevails an ancient and fish-like smell, struggling with the wholesome scent of hot pitch simmering for the manufacture of tarpaulins and waterproofs. Half the houses are draped in nets, some newly tanned to toughen them, others whose long chain of corks is still silvered with herring-scales. The very children are carving boats out of lumps of dark wreck-wood, or holding a mock auction for tiny crabs and spiked sea-urchins. The whole atmosphere of the place has a briny and Neptunian savour about it, and is redolent of the ocean.

A word now as to the fishers themselves; as proud, self-reliant, and independent a race as those hardy Norsemen from whom ethnologists believe them to descend by no fictitious pedigree. Of the purity of their blood there can be little doubt, since the fish-maiden who mates with any but a fisherman is considered to have lost caste; precisely as the gipsy girl who marries a Busné is deemed to be a deserter from the tribe. Marrying among themselves then, it is not surprising that there should be an odd sort of family likeness among them, with one marked type of face and form, or rather two, for the men, curiously enough, are utterly unlike the women. Your French fisher is scarcely ever above the middle height, a compact thick-set little merman, with crisply curling hair, gold rings in his ears, and a brown honest face, the unfailing good-humour of which is enhanced

* Cats! Cats! Cats! 50 Cats are required to capture the rats and mice that are infesting the Government Magazines. Whoever shall bring a cat to Deputy-Controller Martindale's office between 11 and 12 o'clock on any day up till the 28th inst., shall receive one dollar per cat. By order, &c.

by the gleam of the strong white teeth between the parted lips.

The good looks of the women of this aquatic stock have passed into a proverb; but theirs is no buxom style of peasant comeliness. Half the drawing-rooms of London or Paris might be ransacked before an artist could find as worthy models of aristocratic beauty as that of scores of these young fish-girls, reared in the midst of creels and shrimp-nets and lobster-traps. Their tall slight figures, clear bright complexions, and delicate clean-cut features, not seldom of the Greek mould, contrast with the sun-burnt sturdiness of husband, brother, and betrothed; while the small hands and small feet combine to give to their owners an air of somewhat languid elegance, apparently quite out of keeping with a rough life and the duties of a workaday world.

Work, however—hard and trying work, makes up the staple existence of French fisher-folks, as of French landmen. In the shrimp-catching season, it must indeed be wild weather which scares the girls who ply this branch of industry, with bare bronzed feet and dexterously wickled net, among the breakers. Others, a few years older, may be seen staggering under weighty baskets of oysters, or assisting at the trimming and sorting the many truck-loads of fish freighted for far-away Paris. The married women have their household cares, never shirked, for no children are better tended than these water-babies, that are destined from the cradle to live by net and line; while the widows—under government authority—board the English steam-packets, and enjoy the sole right of trundling off the portmanteaus of English travellers to their hotel.

The men, the real bread-winners of the community, enter well provided into the field of their hereditary labour. The big Boulogne luggers, strongly manned, and superior in tonnage and number to those which any other French port sends forth, are known throughout the Channel, and beyond it. They need to be large and roomy, since they scorn to be cooped within the contracted limits of the narrow seas, but sail away year after year to bleak Norway and savage Iceland; and their skippers, during the herring-fishery, are as familiar with the Scottish coast as with that of their native Picardy. It is requisite too that they should be strong and fit to 'keep,' in nautical parlance, the sea; for Boulogne, lying just where the Channel broadens out to meet the Atlantic, is exposed to the full force of the resistless southwest gale, that once drove Philip II.'s boasted Armada northward to wreck and ruin.

These south-west gales, with the abrupt changes of weather due to the neighbourhood of the fickle Atlantic, constitute the romance, or compose the stumbling-block of the fisherman's life. His calling may seem an easy and even an enviable one, to those who on summer mornings watch the fishing fleet glide out of harbour; the red-brown sails gilded by the welcome sunshine and filled by the balmy breeze, the nets festooned, the lines on the reel; keg and bait-can and windlass, harmonising well with the groups of seafaring men and lads lounging about on board; too many, as the novice thinks, for the navigation of the craft. But at any moment, with short warning, the blue sea may become leaden-hued, and the sky ragged with torn clouds and veiled with flying scud, and the howl-

ing storm may drive the fishers far from home, to beat about as best they may for days and nights, and at length to land and sell their fish (heedfully preserved in ice) at Dunkirk, Ostend, Flushing, or even some English harbour perhaps a hundred and fifty miles away.

The conscription, that relentless leech which claims its tithe of the blood and manhood of all continental nations, in due course takes toll of the fishers. The maritime population, however, supplies the navy, not the army with recruits. It is not until flagship and frigate are manned, that the overplus of unlucky drawers in that state lottery of which the prizes are exemption, get drafted into the ranks. These young sailors find military life a bitter pill to swallow. The writer of these lines has before his eyes a letter from a conscript to his mother in the fishing village, and in which the young defender of his country describes last year's autumn manoeuvres in Touraine, the Little War as he calls it, from a soldier's point of view. There is not a spark of martial ardour or professional pride in this simple document. All the lad knows is that he is marched and countermarched about vast sandy plains from dawn till dark, wet, hungry, and footsore; and how difficult it is at the halting-place to collect an armful of brushwood, by whose cheerful blaze he may warm his stiff fingers and cook his solitary pannikin of soldier's soup.

As might be expected, in a community which more resembles an overgrown family than the mere members of a trade, there exists among these people an unusual amount of charity and rough good-nature. The neighbourly virtues shine brightly amid their darksome lanes and stifling courts, and a helping hand is freely held out to those whom some disaster has crippled in the struggle for existence. Bold and self-assertive as their bearing may be, there are no Jacobins, no partisans of the Red faction among these French fishers. They are pious also in their way, seldom failing to attend *en masse* at the church of St Nicholas or the cathedral of Notre-Dame, before they set out on a distant cruise.

Once and again in early summer, a fisher's picnic will be organised, when in long carts roofed over with green boughs, Piscator and his female relatives, from the grizzled grandmother to the lisping little maiden, who in her lace-cap and scarlet petticoat looks scarcely larger than a doll, go merrily jolting off to dine beneath the oaks of the forest. In their quiet way, they are fond of pleasure, holding in summer dancing assemblies, where all the merry-making is at an end by half-past nine, and which are as decorous, if less ceremonious, as any ball can be. They are patrons of the theatre too, giving a preference to sentimental dramas, and shedding simple tears over the fictitious sorrows of a stage heroine; while in ecclesiastical processions the brightest patches of colour, artistically arranged, are those which are produced by the red kirtles, the blue or yellow shawls, and the snowy caps of the sailor-maidens.

The gay holiday attire, frequently copied, on the occasion of a fancy dress-ball, by Parisian ladies of the loftiest rank, with all its adjuncts of rich colour and spotless lace; the ear-rings and cross of yellow gold, the silver rings, trim slippers, and coquettish headgear of these French mermaids; no doubt lends a piquancy to their beauty which might otherwise be lacking. Sometimes an excep-

tionally lovely fisher-girl may be tempted by a brilliant proposal of marriage, and leaves her clan to become a viscountess, or it may be a marchioness, for mercenary marriages are not universal in France. But such incongruous unions seldom end very happily; for the mermaid is, alas! entirely uneducated, and proves at best too rough a diamond to appear to advantage in a golden setting.

EMERGENCIES.

ACCIDENTS of various kinds are continually occurring in which the spectator is suddenly called upon to do his best to save life or relieve suffering without the aid of skilled advice or scientific appliances. A body has been drawn from the water in an insensible condition, and thus far a rescue has been effected; but the scene may be more or less distant, not only from the residence of the nearest doctor, but from any house; and unless the bystander is able to apply prompt means to restore respiration and warmth, a life may yet be lost. Again, a lady's dress is in flames, or it may be fire has broken out in a bedroom—accidents which, if immediate steps be not taken, may end fatally to life and property, long before the arrival of the physician or fire-brigade. One's own life too may be placed in such instant jeopardy that it can only be preserved by active and intelligent exertions on our own part. Situations of this kind attend the sailor, soldier, and traveller as 'permanent risks'; while in the city or field, and even in the security of home, dangers of different kinds confront us which are best described by the word emergencies.

The pressing question in any emergency is of course, 'What is to be done?' Unhappily, the answer is not always at hand. We are often altogether unprepared to act, or we act in such a way as only to increase the danger. The most humane onlooker in a case of partial drowning may at the same time be the most helpless. While in any of the frequent casualties to children—such as choking, scalding, &c.—the tenderest mother may but contribute to the calamity, either by the use of wrong means or the inability to apply right ones. How common this is in respect of many kinds of accidents, and how many of those cases returned 'fatal' might have had a happier issue had the spectator but known 'what to do.'

The terse advice supposed to meet every species of emergency is to 'keep cool.' We admit its force, and agree that it cannot be too frequently insisted upon. Without presence of mind, neither the zeal of self-interest nor the solicitude of affection itself can act with effect. In some instances even, special skill and knowledge may be paralysed by an access of nervousness and its consequent confusion of mind. Again there occur many grave situations in which tact and self-possession are all that are necessary to avert serious calamity. The following anecdote illustrative of this went the round of the newspapers shortly after the disastrous fire in Brooklyn Theatre. Some stage-properties suddenly took fire during a performance before a

crowded audience at a certain European theatre. The usual panic ensued. A well-known actor, aware that the danger was not serious, and dreading the result of a sudden rush from the house, coolly stepped in front of the curtain, and in calm tones announced that his Majesty the Emperor, who then occupied the imperial box, had been robbed of some valuable jewels, and that any one attempting to leave the theatre would be immediately arrested. The threat would of itself have been useless, but the fact and manner of its delivery conveyed an assurance of safety to the excited people which no direct appeal to their reason could have done. They resumed their places; the fire was subdued; and not till next day did they learn the *real* peril they had escaped by the timely ruse of the great actor. How terrible a contrast that unhappy and unchecked panic which led to the loss of life at Brooklyn!

The effects of panic and confusion have sometimes their amusing side. We have seen ordinarily sane people casting crockery and other brittle ware into the street from a height of several stories—to *save it from fire*; and there occurs a passage in one of Hood's witty ballads which seems to prove the incident by no means a rare one:

Only see how she throws out her *chancey*,
Her basins and tea-pots and all;
The most brittle of *her* goods—or any;
But they all break in breaking their fall.

But while a jest may be pardonable in such a case, this losing one's head too often takes place in circumstances involving loss of life or property. An excited pitying crowd, for example, is gathered round a person struck in the street with apoplexy. An alarm has been given, and a curious gaping group has come to witness a case of suicide by hanging. A concourse of people stand before a house from which issue the first symptoms of a fire. In such cases the spectators are usually nerveless and purposeless: the danger to life or property is in the exact ratio of the number of onlookers. How curious and instructive to note the change which comes over the scene on the arrival of a single sensible and self-possessed person. One of the idle sympathisers of the apoplectic patient suddenly frees the neck and chest; a second goes sanely in search of temporary appliances; a third runs zealously for a doctor, and the remainder go about their business. One stroke of a knife and the would-be suicide has been placed in the hands of a few of the more intelligent by-standers for resuscitation. The precise locality of the fire has been reached, and the fire either extinguished promptly with the means at hand, or kept under until the arrival of the fire-engines which have been at once sent for.

Now, what is the real source of this exceptional self-possession—so all-important in an emergency? Is it not, after all, the quiet confidence begot of knowing what is best and proper to be done under given circumstances? It is quite true, no doubt, that presence of mind is a moral quality more or less independent of technical knowledge, but in a plain practical way it is directly *its result*. To become familiar with difficulties is to divest them of their character as such, and to enable us to act with all the coolness and precision exercised in

ordinary events. To a surgeon, an accident is a 'case,' not an 'emergency;' while even an abstract knowledge of 'what to do' arms the mind of the non-professional against excitement or confusion. The possession of one little fact, the recollection of some read or heard of device or remedy, is often, sufficient to steady the mind and enable it to act effectively. How frequently some half-forgotten item of surgical knowledge, some stray prescription, or some plan casually recommended ever so long ago, is the means, here and there, of eluding the fatal possibilities of an emergency.

There is really little excuse for ignorance of the means and methods required to meet ordinary cases, seeing that information in abundance is to be had at trifling cost and with little trouble. There are surgical and medical works, published at almost nominal prices, the expressed aim of which is to instruct the public what steps to take in most kinds of accidents, in the absence of professional assistance. There are works also which, treating mainly of household matters, contain valuable hints to parents and others on the subject of accidents to children, as also of fires to person and property; while here and there in our serial literature may be found useful advice on such special kinds of emergencies as the bolting of horses, capsizing of boats, bites by poisonous snakes, &c. But above all, to those who care to remember what they read, the columns of the daily newspapers afford much sound instruction in every species of untoward event. In spite, however, of the ease with which people might inform themselves, and in spite of frequently bitter experience, there is a very general apathy regarding such matters. In upper and middle class families, a certain amount of interest is no doubt evinced, and books of reference are found in their libraries; but the practical importance of knowing their contents, and so forearming against contingencies, is by no means widely recognised. It is scarcely surprising then to find the masses so indifferent, and as a consequence so helpless to assist themselves or each other in any unusual situation.

The idea of giving the subject some place in the common school course is one, we think, worthy of consideration. Physical education receives a fair share of encouragement in the higher class of schools; and some of the exercises enjoined, such as running, climbing, swimming, and rowing, are direct provisions against accidents by field or water; while all of them, by giving a degree of confidence to the mind, are of the greatest value as a training to meet emergencies generally. Physiology too is gradually making good its claim to the attention of teachers; and the instruction in Domestic Economy prescribed for girls comprises hints how to act in what may be called household emergencies. All this is very satisfactory; and were some pains taken in addition to point out to pupils of both sexes the commoner dangers by which life is beset, and were they told in a plain practical way how these are best averted, we believe the case would be very fairly met. To the skilled teacher, a short series of lessons of this kind would not necessarily be any great tax upon his time, but would rather form one of the most interesting of those 'asides' to which he properly resorts as an occasional relief to the tedium of school-routine.

To children of a larger growth we can only

repeat that the means of informing themselves are not beyond reach. There are, of course, now and then such combinations of circumstances as no knowledge or training can provide for, just as there are many accidents which no human foresight can prevent. Leaving these out of the question, however, few of us pass through life without having at one time or other to exercise our intelligence and knowledge to preserve either our own life or property, or the life or property of others in circumstances where these may be exercised successfully. Our interest and duty alike enjoin us to take reasonable pains to forearm ourselves, and the neglect to do so is clearly culpable. But we may have occasion by and by to present our readers with a few practical hints on the subject of 'What to do in Emergencies.'

THE TRADE IN ARTIFICIAL EYES.

On this subject, the *New York Sun* gives some amusing particulars: 'Between eight and ten thousand eyes are sold annually in the United States. An eye-maker gives one in one hundred and twenty-five as the proportion of one-eyed people. Computing the population of the country at forty-two millions, this rate gives three hundred and thirty-six thousand as the number of persons with only one eye in the Republic. Consequently, while ten thousand people supply their optical deficiency with an artificial eye, two hundred and twenty-six thousand go without. In proportion to the population, the eye-maker said, there are more one-eyed people in Paterson, New Jersey, than any other town in this or any other country. All towns that have many foundries and factories, and whose air is impregnated with soot and smoke, count their one-eyed inhabitants by the score; but Paterson is ahead of the rest. The eye-maker knew of the three proprietors of a single foundry there each losing an eye. Pittsburg comes next. In this city one-eyed folks abound in the neighbourhood of manufacturing establishments. Once he had four patients from near a foundry in West Eleventh Street alone. Not only the foul atmosphere destroys the sight, but flying pieces of metal burn out the eyes of the workmen. An importer who sells one thousand five hundred eyes annually sends one-third to Canada; Chicago takes three hundred; and Cincinnati more than St Louis. New Orleans, Nashville, and other towns west and south buy the remainder. The colour for eyes most in demand is what is known as "Irish blue," a peculiarly light azure that predominates in Ireland. The average cost of an eye is ten dollars. He sells comparatively few eyes in this city, as New Yorkers prefer to have their eyes made to order.'

A NOBLE OCCUPATION.

A newspaper records as follows: 'The Duke of Hamilton left Hamilton Palace for the south yesterday. During his stay of six days he shot 373½ brace of grouse, 4 brace of black-game, 4 hares, and 2 snipes.' This makes a slaughter of seven hundred and sixty-one animals in six days, or at an average upwards of a hundred and twenty-six per diem. Hard work!

THE ROYAL GAME OF GOLF.

For ages golf has been pre-eminently the national game of Scotland. As its history emerges from the mists of antiquity we find football and it linked together as representative games, in fulminations against 'unprofitabill sportis,' unduly distracting the attention of the people from more serious affairs. But our game far exceeds this old rival in interest; and if it were not for the popularity of curling in its season, no rival pastime could pretend to vie with golf in Scotland.

The mode of playing golf is so well known in these days that it may suffice to explain that it is a game played over extensive commons, or 'links' as they are termed; that the implements used are peculiarly constructed clubs, so weighted at the crook or 'head' of the shaft, as to give great impetus to the small hard gutta-percha ball to be driven along the grass; and that the object of the players—either as single antagonists or two against two—is to endeavour to vie with each other as to who shall drive the ball towards and into a series of small artificially made holes, in the fewest strokes. From hole to hole the party proceeds, sometimes one winning a hole, sometimes another, and occasionally (by evenly contested play) halving: until the whole round of the green has been traversed; when the party who has gained the greatest number of holes is declared the winner. The links ought to be of considerable extent, and the holes several hundred yards apart, so as to give opportunity for skilful driving and other niceties of the game. To those unfortunates who have only read of the pastime, it may appear hard to believe in the reality of the enthusiasm shewn by its votaries; but whenever they are privileged to come under its influence, even as spectators, they will find it is one of the most fascinating of pursuits. How can a man describe in fitting language the subtle spell that brings him out in all weathers and seasons, and makes him find perfect pleasure in 'grinding round a barren stretch of ground, impelling a gutta-percha ball before him, striving to land it in a succession

of small holes in fewer strokes than his companion and opponent,' as the game might be described by one of that class of men to whom the 'primrose by the river's brink a primrose is, and nothing more.'

The fascinations of the game have enlisted in the ranks of its votaries men of all classes, many of them famous on other fields, who have made their reminiscences of their beloved pursuit mediums for many a bright word-picture in prose and verse. Hitherto no attempt has been made to gather together what has been so said and sung in praise of the pastime; but in Mr Robert Clark's beautiful volume now before us, entitled *Golf—a Royal and Ancient Game*, ample amends have been made for this neglect, by one of the most enthusiastic and best golfers of the day. Here we have presented in a gossiping way so beloved by golfers, wealth of material, both as regards the history and literature of the fascinating game—a labour of love in an artistic guise. What the author is on the links, so seems he to be among his printers and artists and binders—*facile princeps*. The volume before us, though unfortunately too costly to be very generally available, is a marvel of beautiful typography and tasteful binding. Our author has gone for his information to the most various sources—old acts of the Scots parliament, proclamations by kings, burgh records, minutes of the more prominent golf-clubs, books and magazines; and by judicious editing of this medley has shewn the many-sidedness of the game in a way that none but a devotee could.

Mr Clark wastes no space on unprofitable speculations as to the origin of golf. All that is clear in this vexed subject is that though Scotland is the chosen home of the game, she is not its birth-place. It is, however, of little moment whether the game came in with the Scandinavians who settled on the east coast of Scotland, or whether it was brought northward over the Border as a variety of the English 'bandy-ball;' or even if we have to go back to the Campus Martius, and look for the parent of golf in the curved club and feather ball of the Roman *Paganica*. Games of ball seem

to have existed in all ages, and it is therefore probable that golf is a development of some older game, or perhaps a 'selection of the fittest' from several previously existing ball-games. It is sufficient for our purpose that early in the fifteenth century it was at least as popular with all classes as it is to-day.

When gunpowder made archery a thing of the past, the conflict between love of country and love of golf ceased, and the game went on prospering under the smiles of royal favour, surviving proclamations of various town-councils directed against sacrilegious golfers whose sin was held to be, not so much that they played on Sunday, as on that part of the day called 'the tyme of the sermonnes.' This matter was set at rest by the decree of James VI. of Scotland, who in 1618 sent from his new kingdom of England an order that after divine service 'our good people be not discouraged from any harmless recreation,' but prohibiting 'the said recreations to any that are not present in the church, at the service of God, before their going to the said recreations;' or as Charles I., when subsequently ratifying this order, puts it, 'having first done their dutie to God.'

Besides James VI.'s crowning act of founding the Royal Blackheath Club, Mr Clark has recalled two other instances of royal connection with the game in a charming way, as one of the illustrations in his book is from Sir John Gilbert's picture of Charles I. receiving, during a game on Leith Links, the intelligence of Sir Phelim O'Neill's rebellion in Ireland in 1642; while another is a delicately drawn pen-and-ink sketch by Mr James Drummond, R.S.A., of the house in the Canongate of Edinburgh, which John Paterson, shoemaker, built for himself with half the stake in that famous 'foursome'—the Duke of York (James VII.) and Paterson against two English noblemen.

With the Stuarts went out for a time royal countenance of the game, till William IV. became patron of the Royal and Ancient Club of St Andrews, and presented to it for annual competition that coveted golfing trophy, the gold medal.

But though there came kings who knew not golf, the game lost none of its old popularity. Still, as before, pre-eminently the game of the people, we find it associated with many a notable scene and character in the history of Scotland. So fond of the game was the great Montrose, that hardly had the minstrels ceased to serenade him and his day-old bride 'Sweet Mistress Magdalene Carnegie,' when we find him hard at work with clubs and ball. That fifty years later it continued to be the favourite amusement of the aristocracy of the Scottish capital, we can gather from the curious books of expenditure of Sir John Foulis of Ravelston, who seems to have spent most of his leisure time 'losing at golfe' on Musselburgh and Leith Links with Hamilton and Rothes and others of the highest quality of the time. We read of Balmerino's brother, Alexander Elphinston, and Captain Porteous, the victim of the famous 'mob,' playing in 1724 'a solemn match at golf' for twenty guineas on Leith Links, where, a few years later, might constantly be seen Lord President Forbes of Culloden, who was such a keen golfer, that when Leith Links were covered with snow he played on the sands; though even he has to yield in all-absorbing devotion to the game to Alexander McKellar, 'the Cock o' the Green,' immortalised in Kay's *Portraits*, who played every day and all day

long, and then practised 'putting' at the 'short holes' by candle-light.

It is almost superfluous to say that in our own day the noble and ancient pastime is still the game of the Scots, and latterly of the English, of all classes and in all parts of the world. One little fact that incontestably proves the eminent respectability of the game is that 'the minister' can be a golfer without the least fear of the strait-laced of presbyteries. It is said that when the canny Scot abroad 'prospects' for a new settlement, while he naturally rivets one eye on the main chance, with the other he reckons up the capabilities of the ground for his favourite game; therefore it is that golf has taken firm root and flourishes in many a distant colony. Across the Border the game is so acclimatised that formidable rivals to our native players are now trained on well-known English greens. That it may go on and prosper is of course the wish of every true lover of the invigorating pastime.

Mr Clark gives us some historical notes of the more prominent of the many golfing clubs that now flourish in different parts of Scotland, and extracts from their minute-books the leading events of their career. Now and then we come across eccentricities, such as the feats of Mr Seales and Mr Smellie of the Edinburgh Burgess Club in driving balls over the dome of St Giles's Cathedral, one hundred and sixty-one feet high; or the even more wonderful achievement of another member of this club, who drove a ball in forty-four strokes from *inside* their golf-house on Bruntsfield Links over the hill of Arthur Seat. As a rule, however, these clubs pursue the even tenor of their way, the members finding their best happiness in playing the pure and simple game.

While the Honourable Company of Edinburgh Golfers is generally held to be the oldest Scotch Club, so great has been the development of its sister Club at St Andrews, and so great are the attractions of golfing on the famous links of the venerable city, that the 'Royal and Ancient' takes precedence over all, and is indisputably *the* club of the kingdom. What Newmarket is to racing, or Melton to hunting, St Andrews is to golf. In St Andrews, it is not a mere pastime, but a business and a passion. It is the one recreation of the inhabitants from the Principal of the College to the youngest urchin; it has even invaded the domain of croquet, and has taken captive the ladies, who now take so keen an interest in the game, that on more links than those of St Andrews their green is a charming feature of the place. In short, in St Andrews 'no living thing that does not play golf, or talk golf, or think golf, or at least thoroughly knock under to golf, can live.'

The chief prize of the 'Royal and Ancient'—the gold challenge medal played for every autumn, presented in 1837 by King William IV.—is termed the 'Blue Ribbon of Golf.' To win it is the dream of every member of the Club. Other clubs, such as North Berwick, Musselburgh, Montrose, Perth, Prestwick, Burgess, &c. have each its own time-honoured challenge trophy, that of the Royal Musselburgh being laden with more than a century of medals commemorating each winner. That English clubs too are following fast the fashion set by their older brethren north of the Tweed, is attested by the prizes now competed for at Westward Ho!

in Devonshire, Hoylake in Cheshire, and at Wimbledon, &c.; though it is but fair to state that Blackheath claims with good reason to be father of all English golf-clubs, and has for long been celebrated for the keenness of its players and the prizes offered for competition.

So much for the history of the game; let us now glance at its literature. In the interesting collection of prose papers Mr Clark has gathered from various quarters, we can study the peculiar features of the game and the effect it has, for the time, on the tempers of its votaries. As we have seen at St Andrews, the ardent golfer has little time for thought or conversation unconnected with the game. For the time being the be-all and end-all of his life lies within the pot-hook-shaped course he has to traverse; and not a little of his happiness or his misery for the day depends on the nature of the match he succeeds in getting. Though the game is as a rule an exceedingly social one, and admits of quiet chat and occasional good-natured banter, the *true* golfer at work is essentially a man of silence; chattering during the crises of the game is as abhorrent to him as conversation during whist; one thing only is as obnoxious as the human voice to him then—that is, any movement of the human body near him. ‘Stand still while I’m putting,’ and ‘Don’t speak on the stroke,’ are two postulates he would fain enforce. This over-sensitiveness to external influences may explain the seeming ungallantry of the ‘Colonel’ in H. J. M.’s amusing account of *The Golfer at Home*, which appeared in the *Cornhill Magazine* a few years ago. After a charming little picture of the ‘Colonel’ resenting, though he does not openly object to Browne being accompanied over the course by ‘his women,’ as he ungallantly terms Mrs Browne and her sister, he says to his partner: ‘The Links is not the place for women; they talk incessantly, they never stand still, and if they do, the wind won’t allow their dresses to stand still.’ However, as they settle down to their game, the ‘Colonel’s’ good temper returns under the healthy influence of an invigorating ‘round,’ and gives H. J. M. an opportunity of pointing out how all ill-humours of body and mind give way before the equable and bracing exercise of a round or two of the Links of St Rule. That the reader may see the amount of walking exercise taken in a round of St Andrews Links, it may be interesting to note that the exact distance, as the crow flies, is three miles eleven hundred and fifty-four yards; so that the golfer who takes his daily three rounds walks at least eleven miles. It is no wonder, then, that in addition to its own attractions, golf is esteemed as a capital preparation for the moors or the stubbles, hardening as it does the muscles both of arms and legs. What hunting does for the cavalry soldier as a training for more important bursts in the battle-field, the like does golf for the infantry soldier in bracing him to encounter forced marching with ease. The Links have formed the training-ground of many a brilliant officer.

Space will not allow us to dwell on the genial gossip about St Andrews and St Andrews players—amateur and professional—that we find in Mr Clark’s book, further than to mention three names. First, that of the great champion of the professionals, Allan Robertson, who was ‘never beaten in a match;’ of the brilliant but short-lived

career of poor ‘young Tom Morris,’ the champion player of his day—son of a worthy sire who still survives; of Mr Sutherland, an old gentleman who made golf the chief business of his life, whose interest in his fellow-men, not as men but as golfers, is well shewn in this anecdote. His antagonist was about to strike off for the finishing hole at St Andrews, when a boy appeared on the bridge over the burn. Old Sutherland shouted out: ‘Stop, stop! Don’t play upon him; he’s a fine young golfer!’

It is in verse, however, that the votary of golf finds the field congenial to his subject.

In 1842 appeared a clever collection of poems, entitled *Golfiana*, by George Fullerton Carnegie of Pittarrow, which delighted the golfers of that day by the humorous way in which it lit off the playing characteristics of the men he introduced into it. He begins by throwing down the gauntlet to those students of Scottish history who sigh over the musty memories and deplore the decayed glories of the city of their patron saint.

St Andrews! they say that thy glories are gone,
That thy streets are deserted, thy castles o’er-
thrown:

If thy glories be gone, they are only, methinks,
As it were by enchantment transferred to thy Links.
Though thy streets be not now, as of yore, full of
prelates,

Of abbots and monks, and of hot-headed zealots,
Let none judge us rashly, or blame us as scoffers,
When we say that instead there are Links full of
golfers,

With more of good heart and good feeling among
them

Than the abbots, the monks, and the zealots who
sung them!

We have many capital songs in honour of the game; amongst others a parody of Lord Houghton’s well-known song, *Strangers yet*, from which it will be seen that something more is necessary to make a good golfer than a set of clubs and an anxious ‘cady’ to carry them:

DUFFERS YET.—BY TWO ‘LONG SPOONS.’

After years of play together,
After fair and stormy weather,
After rounds of every green
From Westward Ho! to Aberdeen;
Why did e’er we buy a set
If we must be duffers yet!

Duffers yet! Duffers yet!

After singles, foursomes—all,
Fractured club and cloven ball;
After grief in sand and whin,
Foozled drives and ‘putts’ not in—
Ev’n our cadies scarce regret
When we part as duffers yet,

Duffers yet! Duffers yet!

After days of frugal fare,
Still we spend our force in air;
After nips to give us nerve,
Not the less our drivers swerve;
Friends may back and foes may bet,
And ourselves be duffers yet,

Duffers yet! Duffers yet!

Must it ever then be thus?
Failure most mysterious!
Shall we never fairly stand
Eye on ball as club in hand?
Are the bounds eternal set
To retain us duffers yet?

Duffers yet! Duffers yet!

In conclusion, we may remark that though golf, to the uninitiated, may appear to be a game requiring considerable strength of muscle for its achievement, it is not so; for the easier it is played, the better are the results. To apply much force to the stroke is to imperil the chance of driving a far ball; whereas by a moderate swing of the club, the ball is not only driven far and sure, but goes from no effort apparent to the striker.

A notion also prevails that golf is a game suited for young and middle-aged folks only. This is a delusion, for no outdoor pastime is more fitted for elderly people. To attain great excellence in the game, the player must commence early in life; but to become enamoured of its joys requires but a beginning, and that beginning may be made by men who have long passed the meridian of life. We could point to many elderly gentlemen whose lives are being lengthened by the vigour-inspiring game, and who, when their daily round or rounds are finished, can fight their battles o'er again in the cheery club-house, with all the zest of youth. When games such as cricket have been found too much, or perhaps the exertion of tramping the moors too severe, the sexagenarian may safely take to the easy but invigorating pursuit of golf, and 'bless the chiel who invented it.' If he misgives his ability to cope with the exertion, or fancied exertion, of pacing a few miles of green turf and wielding a club, our advice to him is to place himself in the hands of a professional golf-player—plenty of whom are to be found wherever there are links—and try; and in a wonderfully short time our veteran may find himself interested, perhaps absorbed, in a game the delights of which he has lived all these years without having been able till now to realise!

FROM DAWN TO SUNSET.

PART III.

CHAPTER THE SECOND.

DEBORAH waited and watched—a gloom unutterable weighed on her spirits—and no Mistress Fleming came. At last old Jordan Dinnage arrived at the castle alone, looking scared and sorrow-stricken.

'The master is very ill,' said Mistress Marjory, as she waited on Jordan. 'These be bad days, Master Dinnage. I doubt if he lives till morning. Doctor says he won't; but doctors know naught. In general, if doctors say "He'll be dead by mornin'," it means he'll live to a good old age; I've seed it often. But mark my words, Jordan Dinnage; there's not much life in our dear Master; he's goin'. This comes o' leavin' Enderby. I felt it; I knew'd 'twould be so. *This comes o' Master Sinclair's leavin's.* O Jordan Dinnage, it's wrong, it's grievous wrong, this leavin' Enderby, for this grand blowed-out old place, an' these flaunting livery-men an' maids. Master Sinclair's curse is on us!'

'Nay, nay, Mistress Marjory; these be women's superstitions. Mistress Deborah did rightly. A goose she would ha' been to fling all this grandery and gold guineas in the ditch, for fear o' bad luck, 'sooth! It's no more than thou'rt a wise woman! The Master'll pull through; an' if he don't, better die a prince than a beggar.'

Marjory shook her head. 'Give me honest beggary. An' where's Mistress Dinnage? Be sure Lady Deb 'ud be glad o' her company now. Why didst not bring her along, Jordan? It speaks not much for her love.'

Jordan reddened. 'Not a word agen Meg, Mistress Marjory! She'll be comin' soon. I must see Mistress Deborah.'

'Well, come now. An' heaven send Master Kingston soon.'

Deborah met the dear old man with outstretched hands. 'Jordan, I am so glad to see ye! Where is Margaret?'

Jordan shuffled from one foot to the other, and twisted his hat round in his hands. 'Well, Lady Deb—Mistress Deborah—I've not brought Meg along.'

'I see ye have not!' cried Deborah impetuously. 'But where is she?'

The old gray eyes, growing dim with age, looked straight and honestly on their young Mistress, yet humbly too, as he answered in a low voice: 'Where she ought to be, Mistress Deborah—off to her young husband, Master Charlie Fleming.'

'Jordan, Jordan! Is this true? Her husband? Ye bewilder me. Are they wedded then? Is she gone to Ireland?'

'Sure enow! O Mistress Deborah, I come to ask forgiveness! It isn't for the like o' Jordan Dinnage to have his daughter Mistress Fleming; but dear heaven knows I know'd naught, an' never sought it out, nor had high notions. Mistress Deborah, I ask forgiveness, an' I hope the master'll forgive me.'

Deborah took the old trembling hand. 'The master is in no state to blame or to forgive. But, Jordan, thou may'st give me joy o' this. It gladdens mine heart in my sore troubles like a sunbeam on a dark, dark cloud. Forgive thee? Ay, I am prond to be Margaret Fleming's sister; an' well believe my father would bid her welcome too—faithful honest Jordan. Now come, Jordan, come, and see how he lies. He knows me not, and he calls ever upon Charlie. Hast sent my letter to Ireland? Hast the address?'

'Ay, ay; it's gone.'

'Then I will write again to-night. Heaven send he may come in time. Sometimes, Jordan, he lieth in a stupor; again he calls for Charlie or for me.'

Reverently pulling his white forelock, with his old habit of respect, to his fiery but beloved master, Jordan stood at the foot of the bed, and saw the shadow of death on the face of Vincent Fleming.

'My boy,' murmured the dying man, with his eyes upon Jordan—'my boy Charlie!'

Old Jordan gazed helplessly and sorrowfully from him to the doctor who stood by, and Marjory, who entered. 'What's to be done?' he muttered. 'It kills him!'

'Patience, patience!' whispered the solemn doctor; 'he may see his son yet. There is great hope for him, Mistress Fleming; keep good heart.'

'Not hope of his recovery, Master Allan,' said Deborah, with stern and still despair. 'I know death when I see it. You have held out hope before; yet make him live till my brother comes. Ye hear me, Master Allan?'

'Ay, Mistress Fleming; I will use my poor skill to the utmost. Bear up. I will return to-night, Mistress Fleming;' and with a courtly bow, he left her.

But for Deborah, she kneeled beside her father, and with old days and old memories her heart was like to break. Jordan was weeping bitterly; she heard the old man's sobs; but on her own heart a still Hand was laid, enforcing strength and calmness. For two things she prayed: that Charlie might come in time; and that her father might be himself before he died, to hear that Charlie had ever been true to him. And so through the long night she watched; and old Marjory oft slept and nodded, as age and dulled senses will; and though Sir Vincent at times called plaintively for his Deb, his 'Rose of Enderby,' his more frequent plaint was for his boy.

CHAPTER THE THIRD.

In those days there were wild doings in Ireland. 'Liberty and Reform' were the watch-words which did then, and ever will, electrify the fiery, rebellious, ardent spirits that flocked under one banner to struggle and to die. Irish and French met and fought together against the iron hand of England; thousands perished; the fated isle ran blood.

It is the eve of a battle. Gray dawn is slowly breaking over forest and mountain, where strange and wonderful echoes are wont to be heard amongst the rocks and caves; but in the gray of this dread dawn, on the eve of battle and blood, all seems silent as the grave, saving the thunderous roar of the waterfall in its descent into the lake, that seems to make the silence the more intense.

But hark! through the mist of morning a bugle suddenly sounds loud and clear; and when it ceases—far away, a spirit-bugle answers. A soldier, driven to frenzy, they say, by an insulting taunt from a superior officer, had struck him down in the heat of the instant. Short shrift in those days; the man has been tried, condemned, and is about to be led out to execution. So, loud and clear the bugle calls: 'Come forth to thy death,' as plain as a human voice could speak; and he whom it summons cannot mistake that voice, and comes forth guarded, but with steady step, and head erect and soldierly; while in front of him bristles a long line of musketry, and behind yawns an open grave. The condemned soldier is Charles Fleming. Have his ungovernable passions and his strong uncurbed will brought him to this? Ay; and the stubborn pride which has ever been his bane, leads him now to die without that word of extenuation or appeal which even yet might save him.

Yet who may tell how that proud heart swells well-nigh to breaking beneath the broad breast, as he thinks on the old white-haired father and his son's death of shame! He sees too the shadows on the woods of Enderby. He hears the voice of a little sister, calling 'Charlie, Charlie!' at play. And the trees are waving their long arms round the old, old home; and his little playmate Margaret—his young wife Margaret—stands beneath and smiles. And then his bold eyes ask for death, merciful death, which shall put him out of his anguish. Yet hold! Even as the muskets are raised, but ere the triggers are pressed, there is a wild shriek of 'Rescue! rescue! Pardon! pardon for Charles Fleming!'

And there, headlong down the way—while all

reel back before him—rides one spurring for life or death, his horse in a lather of foam, his head bare, and his long hair flying in the wind. In one hand he clenches a packet, and waves it above his head—the Royal pardon! He reaches them; he stays the deadly fire with his wild outstretched arms raised to heaven, with white face and blazing eyes, and lips which fail to speak. But *one* could have undertaken and accomplished that famous ride; but *one* could have saved him in this strait. In male disguise, that one proves to be Margaret Dinning! 'Tis my wife!' cried Charles Fleming in piercing accents; 'tis my wife Margaret! And with that, the king's messenger sways in the saddle, and is supported to the ground by the commanding officer. . . .

And thus it came to pass that Deborah, watching at her father's bedside, heard rumours of that battle by which the name of Charles Fleming became famous. It was early morning. The great wild clouds of dawn were parted, and rolled asunder. The glorious sun rose on the watcher's weary eyes, and steeped the land in splendour. Deborah threw up the windows wide, and returned to the dying man. O heaven, tender mercy, cannot the light of summer sunrise rob that dear face of aught of its wintry wanness?

'Father, sweet father!' she said in thrilling tones of grief, 'art thou not better? See the glorious sun, father!'

'Nay, Deb,' he answered plaintively; 'I see no sun; mine eyes are dark. How little thou dost look to me! Thou'rt grown so small! My child, my darling, I am very ill.'

Then Deborah raised his head upon her shoulder; she knew that he was himself again, himself but to die; her brave heart sank, yet she answered calmly: 'Yes, thou hast been very ill. Dost thou remember all that happened?'

'Ay, ay. My boy, my boy!' And he sobbed.

'Hush, father; that was wrong; that was false! That was a wicked forgery. Charlie never wronged thee by thought or deed. Charlie hath ever been loyal to thee and thine. Art thou content now, dear?'

A brilliant smile stole over the fading face of Vincent Fleming. 'Ay,' said he, 'content to die!' He lay musing, his eyes closed. 'Deb,' said he at last, 'whisper me. My boy is true to me—is't not so?'

'Yes, father; true as steel: he loves thee dearly. And for thee,' she went on, with heaving breast, 'he hath done brave things! Charlie is a soldier, and men are all saying he hath won great honour and renown.'

'Ah, Deb; thank God, thank God for this! And thou, Deb, sweet Deb, how is't with thee?'

'I am rich, dear. I am betrothed to King Fleming, whom I love most dearly; and I have wealth enough for all. It is well with thy two children, thou seest.'

And ere the night fell, two messengers came gently to his side. One, radiant with 'white raiment' and drooped wings; the other, footsore, travel-stained, and war-worn. And one was the Angel of Death, who stood and looked upon them pitifully; the other was his prodigal son, who kneeled and folded his arms around his father, and bowed his head and wept.

'Now,' said Sir Vincent, 'I die in peace. How

have I yearned for thee! God bless thee! I bless thee, my boy! Deb, this is death!

And so, raised in Charlie's strong arms and with his hands in Deborah's, without a struggle, the spirit passed away.

CHAPTER THE LAST.

Two figures stand together in one of the deep oriel windows of the old hall at Enderby. The blood-red splendour of a setting sun fills the marsh, the low land, and the hanging woods; and streaming like a beacon in at the windows, floods those two with radiant light. They are Charles Fleming and his bride. The storms have swept by, and left her thrice his own, with the old walls and the sacred hearth of Enderby. Thus may God send on us the lightning of His chastisement, and yet guide and guard us through all—through the morning of wild and sunny childhood; through the noon of gay and love-bright youth, environed as it is by perils; through the sudden-falling night of dread, despair, and death. He does not leave us 'comfortless.' As for Deborah Fleming, passionately as she loved the beauteous world, she never again lost sight of the valley up which had passed the souls of those she loved, and the golden gates across the shining flood. And in later days, when children's children clustered eagerly round the stately old Lady of Lincoln, she, with the faithfulness of old age, would return lovingly, lingeringly to the days of her youth, when 'Charlie and she were young.'

O happy time—blessed childhood—how can I end better than with thee? Over the shadows of evening rises the day-star of childhood's memories.

It knows no night—

There is no night in a glad and green old age.

THE END.

CHARLES DICKENS' MANUSCRIPTS.

A GLIMPSE of the manuscripts of the late Charles Dickens, which now form part of the 'Forster Collection' in the South Kensington Museum, conjures up a vision of numerous characters in his popular novels. On looking attentively at the manuscripts, we are at once struck by the number of alterations and interlineations with which the pages abound; and our first sentiment is one of surprise that the books which appear so wonderfully natural and fluent when we read them, should evidently have been the result of much anxious thought, care, and elaboration.

The collection comprises the original manuscripts of the following works: *Oliver Twist*, published in 1838-39; *Master Humphrey's Clock*, comprising the *Old Curiosity Shop* and *Barnaby Rudge*, published in 1840-41; *Barnaby Rudge*, a separate volume, 1840-41; *American Notes*, 1842; *Martin Chuzzlewit*, 1843-44; *The Chimes*, Christmas 1844; *Dombey and Son*, 1846-48; *David Copperfield*, 1849-50; *Bleak House*, which has in the original manuscript a secondary title, *The East Wind*, 1852-53; *Hard Times*, 1854; *Little Dorrit*, 1855-57; *A Tale of Two Cities*, 1859; and *The Mystery of Edwin Drood* (his last but unfinished

work), 1870. There are also proof volumes from the printers, consisting of *Dombey and Son*, *David Copperfield*, *Bleak House*, and *Little Dorrit*, the pages of which bear marginal and other corrections and alterations, in ink, by the author.

Of course, as the collection is placed under a glass case, the public can only see one or two pages of each work; but even with this meagre guide, the acute observer is able in some degree to trace the working of the writer's mind, and to follow to some extent the development of his ideas. As we have already remarked, the first thing which strikes us is the comparatively large number of alterations and interlineations which occur in the manuscript. It is evident that Charles Dickens wrote with the greatest care, and scrupulously revised his writing, in order to render each sentence as perfect as might be. Taking the works in their chronological order, we may notice that in *Oliver Twist*, which is open at 'Chapter the Twelfth'—'In which Oliver is taken better care of than he ever was before, with some particulars concerning a certain picture'—there are few alterations in the manuscript; the writing also being larger and firmer than in the majority of the later works. Charles Dickens made his alterations so carefully that it is difficult to trace the words which he had originally written; but the one or two which occur on this page give us some little insight into the careful manner in which the author worked up his sentences into a well-rounded and euphonious form. The passage at which this manuscript is opened runs as follows: 'The coach rattled away down Mount Pleasant and up Exmouth Street—over nearly the same ground as that which Oliver had traversed when he first entered London in; and here occurs the first alteration, 'the D——' is erased, and 'company with the Dodger' is written in its place; the author evidently considering the latter a more euphonious form of expression than 'in the Dodger's company,' as it was doubtless his original intention to make the passage. The alteration to which we have referred may appear, as indeed it is, of exceedingly small significance; but we have mentioned it simply as an instance of the extremely careful way in which Dickens studied the details and minutiae of composition.

The next manuscript in point of date is *Master Humphrey's Clock*, which is open at 'No. IV.,' headed 'Master Humphrey from his clock-side in the chimney corner,' and commences as follows: 'Night is generally my time for walking. In the summer I often leave home early in the morning and roam about fields and lanes all day, or even escape for days or weeks together, but, saving in the country' [this originally stood 'but, at other seasons of the year;'] but Dickens doubtless saw that the expression as it now stands would be more consistent with the context, 'I seldom go out until after dark, though, Heaven be thanked, I love its light and feel the cheerfulness it sheds upon the earth as much as any creature living.' This page of manuscript has only a moderate share of alterations.

Then we come to the volume of *Barnaby Rudge*, which is opened at 'Chapter One,' and also contains only a moderate number of alterations, one being in the height of the *Muyppole* sign, and another in the distance of Epping Forest from Cornhill;

both of which are noticeable as further illustrations of the conscientious love of accuracy which characterised the author's mind. Next in order follows the *American Notes*, which has very few corrections, and is opened at the page headed 'Chapter the First. Introductory and necessary to be read;' in which the author challenges the right of any person 'to pass judgment on this book or to arrive at any reasonable conclusion in reference to it without first being at the trouble of becoming acquainted with its design and purpose.' Surely a caution fair and reasonable enough on the part of the writer of a book which he could not but feel would probably give offence, where such an end was farthest from his wish.

The Life and Adventures of Martin Chuzzlewit comes next, open at 'Chapter I. Introductory. Concerning the Pedigree of the Chuzzlewit Family;' and giving us a brief but telling satire on the pride of birth by assuring us that this family 'undoubtedly descended in a direct line from Adam and Eve, and was in the very earliest times closely connected with the agricultural interest.' This page is notably full of alterations, and seems a fair indication that with Charles Dickens, as with many others, the first step was the most difficult of all. The caligraphy in this as in all the other manuscripts is legible but rather small, the letters being distinctly formed, and the use of abbreviations studiously avoided.

We next turn to *The Chimes*, one of those delightful stories with which Dickens introduced to us those Christmas annuals, which now form so important a section of our periodical literature. This again is open at the commencement, where the author lays down the dogma that there are not many people who would care to sleep in a church: 'I don't mean at sermon-time in warm weather (when the thing has actually been done once or twice), but in the night, and alone.' This sentence originally finished with 'in the night;' but we can readily imagine the development of the idea in the brain of the writer; and the words 'and alone' suggesting themselves as lending an additional ground of fear for the situation. The manuscript of this page bears a moderate number of alterations.

In *Dombey and Son* we find a large number of alterations on the first page, the very title itself having been altered more than once. The sketch of the newly-born Paul, who was placed in front of the fire, 'as if his constitution were analogous to that of a muffin, and it was essential to toast him brown while he was very new,' is very good indeed; but it is evident that the passage was rather the result of careful elaboration than of spontaneous humour. And the same remark will apply to the opening chapter of *David Copperfield*, in which, although the passage descriptive of the birth of the hero is very neat and natural as it now stands, the same careful revision and alteration are again apparent.

Black House too is notably full of alterations on the first page, especially in the passage which tells us that in the muddy condition of the London streets 'it would not be wonderful to meet a Mesalosaurus forty feet long or so waddling like an elephantine lizard up Holborn Hill.'

In *Hard Times*, where we are introduced to the gentleman who wants nothing but 'Facts,' and in the opening chapter of *Little Dorrit*, in which we

have a description of Marseilles as it 'lay broiling in the sun one day,' we find a large number of alterations; but in these, as in most of the other instances, the primary words have been erased so carefully, that it is next to impossible to form an idea of how the passages originally stood. *The Tale of Two Cities*, on the contrary, contains remarkably few corrections; and the opening passage descriptive of 'The Period' is telling, and apparently written spontaneously. *The Mystery of Edwin Drood* has been opened with good judgment at the last page. The manuscript is very small, but fairly legible, and having but a moderate number of alterations. In a literary sense, it is not perhaps so interesting as some of the others; but it possesses a sad and melancholy claim upon our attention and sympathy, inasmuch as it is the last page of manuscript ever written by this gifted hand.

In the proof volumes with corrections in the handwriting of the author there is nothing which calls for especial note save an unimportant deletion in *Black House*, and a more interesting alteration in *David Copperfield*. In the former there is a passage marked 'out,' in which Sir Leicester Deilock speaks to Mrs Rouncewell of her grandson in the following passage: 'If (he said) the boy could not settle down at Chesney Wold, in itself the most astonishing circumstance in the world, could he not serve his country in the ranks of her defenders, as his brother had done? Must he rush to her destruction at his early age and with his parricidal hand strike at her?'

In *David Copperfield* we find by a passage in which Mr Dick is referring to his Memorial that his original hallucination took the form of a 'bull in a china shop;' a rather trite idea, and it was not until after the proof had actually been submitted to him by the printers that Charles Dickens introduced the whimsical and happier notion of 'King Charles's Head.'

Before bringing our brief paper to a conclusion, we would venture to suggest to the gentleman or gentlemen to whom is intrusted the arrangement of these manuscripts, that the present positions of the manuscripts and printed volumes should be transposed, so that the manuscripts should occupy the lower half of the case, as in their present position it is rather difficult to decipher the caligraphy; and to any one below the ordinary height it must involve an amount of physical contortion as uncomfortable as it is inelegant. The manuscripts being of course of greater interest than the printed proofs, should certainly occupy the more prominent space, especially as the latter could be read without any difficulty if placed in the rear rank.

We have no doubt that many of those who read this short article will have seen the Dickens manuscripts for themselves; many more doubtless will see them; but there will still be a large number who will not have the opportunity; and while we think that our remarks will be endorsed by the first and second classes, we hope that they will prove interesting to the third less fortunate class, and will enable them to enjoy, at least in imagination, a somewhat closer intimacy than they have known before with that great and gifted man, whose books have effected so many beneficial changes both in society at large and in many an individual heart and life, uprooting and casting to the winds much

that was base, worthless, and contemptible, and implanting in their stead the seeds of those gentler sympathies and nobler aspirations which find their fruition in a well-spent life.

THE ADMIRAL'S SECOND WIFE.

CHAPTER XII.—OTHER EVENTS OF THAT EVENING.

LADY DILLWORTH'S reverie is doomed to be a short one. She feels a soft caressing touch on her arm, and looks up to see Miss Delmere close by her chair. Her long light hair is streaming over her shoulders, and an embroidered Indian dressing-gown covers her antique dress.

'Liddy, you quite frightened me! Why do you come creeping in like a mouse? You ought to be in bed.'

'I have something to tell you, Katie; something you will be so glad to hear, and something that makes me so happy. I cannot sleep till I tell you all about it.'

Miss Delmere flings herself on a low stool at Katie's feet, and looks up through her mass of sunny hair with flushed cheeks, glowing eyes, and lips that will form themselves into smiles. She cannot hide her joy.

'Walter Reeves has asked me to be his wife. Are you surprised, Katie?'

'Not exactly; I thought there must be some outcome from all that flirting. Do you know, Liddy, if he had not made you an offer, and if you had not accepted him, I should have been very angry, and should have given you a lecture.'

Liddy looks up at her friend with surprise, the words are so cold, the tone of voice so hard and unsympathising.

'Are you not glad about it, Katie?'

'Of course I am; and I hope you will both be happy.'

'I owe it all to you, darling Katie! Had it not been for this dear delightful charade party, I should never have found out that Walter really cared for me. How sudden it has all been! And what good news I shall have to carry home to-morrow! Little did I think when I came to stay with you, that my wedding was so near!' The words came out in joyous gasps between hugs and kisses, for Miss Delmere is demonstrative, and shews it.

Then Liddy flits away, radiant in her delight, never dreaming of the anguish in Katie's heart that constrains her again to bury her face in her hands, and utter short, eager, impassioned prayers for the poor sailors whom she believes are at that very hour in dire and mortal conflict with the winds and waves.

But we must take a glimpse at Sir Herbert's proceedings. He never even glances at the order after his wife's fingers have altered it to her will; he merely folds it up, puts it in the envelope, and despatches it to its destination. Though he decides the *Leo* shall proceed on the dangerous enterprise, no thought of malice towards Captain Reeves actuates him. He never enters his thought that it is a good way of getting rid of him for a while, and thus stopping the constant visits to Government House. The idea is altogether too paltry and despicable—it is beneath a man of Sir Herbert's tone of mind. He fixes on that particular ship simply because she is best fitted for the duty. Weighing anchor in such a storm near the Short

Reefs on an iron-bound coast, and rendering assistance to a vessel in danger, is an undertaking that requires a good ship, a steady crew, and an able captain.

All these qualifications the *Leo* possesses to perfection. She is a well-built handsome craft; her hardy tars are smart and well disciplined; and there is no braver officer in the British navy than Walter Reeves. True, when on shore he seems rather too fond of amusement, and has been called 'conceited,' 'trifling,' 'frivolous,' 'dandified,' and what not, by men who are jealous of him; but let his foot once touch the quarter-deck, and even his enemies can never charge him with these questionable qualities. There all his frippery and nonsense vanish away like dew in the sunshine; and he becomes the true sailor, with courage to plan and carry out deeds of daring; he becomes the gallant officer fired with vigour and ambition. Never would he shirk a duty or hesitate to undertake any lawful enterprise even though it led to danger or death. Sir Herbert knows all this, and therefore he is right in selecting the *Leo*.

Hardly has he sent away the order when he is called off to Hillview; and when his duties there are over, he determines to pay a farewell visit to Lady Ribson. He thinks of Katie all the way he is going to Belton Park. But when is he not thinking of her? His love has not lessened, though he has begun to see her faults. He is sorry she is not with him, and that she has never paid the needful respect to his god-mother. He has often and often urged her to call, but his persuasions have failed. Whenever he has made the suggestion, Katie has been so overwhelmed with engagements that she has hardly given him a hearing, and of late he has dropped the subject. He goes towards Belton Park in rather a gloomy mood after all. Lady Ribson quite expects Katie on this last evening, and while she welcomes the Admiral, she looks over his shoulder inquiringly.

'Ah! I knew you would come to say "good-bye," Herbert. But where is the "gudewife," the bonnie Katie?'

'Miss Delmere is staying with her, and she has many engagements; besides, you could hardly expect her out in this storm.'

'Ah no, certainly not. There are many reasons for Lady Dillworth's staying at home, and but few inducements for her to come out to see an old woman like me.'

'Katie has often said how anxious she is to know you.'

'True, true, Herbert; so you must bring her to Scotland with you in the bright summer-time—that is, if I'm spared to see it; but life is uncertain, my friend, life is uncertain.'

Lady Ribson, who is the brightest, kindest, dearest old woman in the world, smiles on her god-son, and does not let him see how much she is hurt by Katie's neglect of her; but in her heart she is sorry for him, more sorry than she would like him to know. Bessie his first wife was in her opinion perfection; and Katie she suspects is very much the reverse.

To her old eyes, the Admiral is still young, and she thinks there is hardly a woman in the world good enough to mate with him. 'I can see Herbert is not happy; and Laura Best was right when she foretold the risk her father ran in marrying a mere frivolous girl,' she decides in her own

mind ; but none of her suspicious float to the surface, so gay, so kindly, so warm is her manner. The Admiral sets out early on his homeward journey ; his thoughts still turn to Katie, but they have grown softer, more tender. The gloom has passed from his spirit ; the interview with Lady Ribson has calmed his ruffled thoughts ; his reserve and pride have altogether melted down, and he longs to press his darling wife to his heart and forgive all her follies. He feels, even with all her failings, he loves her more completely, more passionately than he has ever loved the dead Bessie.

When he reaches Government House, it is brilliantly lighted up. The guests are assembled, and fragments of song and melody are floating out on the rough night-wind. Sir Herbert makes his way at once to the scene of festivity, and pauses at the door, astonished at the unwonted appearance of the room. As he has not been initiated into the arrangements, nor witnessed the preparations, the merest stranger present is not more ignorant than he is of all that has been going on. So he looks on the scene with curiosity. The music-room has been turned into a raised stage, with painted wings and festoons of scarlet curtains. A crescent-shaped row of gas jets serves as foot-lights, and throws a soft clear brilliance on the performers. Wreaths of flowers, clusters of trailing evergreens, pots of rich exotics, groups of banners, add to the display. Nothing that taste, art, fancy, or money can accomplish is wanting. The Admiral looks at all this ; then at the rows of spectators ; then at his wife, who comes forward on the stage at that moment leaning on Liddy's arm. Presently their voices ring out through the rooms ; then a solo falls to Katie's share, and her husband listens spell-bound to her singing. Her voice is tuned to the deepest pathos, and her face is sad as her song.

Never has he seen Katie look like that before. The curiously cut costume suits her wonderfully well ; the dress of azure silk falls in rich bright folds ; her bodice glitters with gold and gems ; and her hair turned back in its own luxuriant wealth of tresses, has no ornament but a diamond cluster. The mellowed rays from gas jets, hidden by the curtains, fall full on her head, and she shines out as though surrounded by a strange unearthly glory.

She seems altered, spiritualised, refined, incorporealised in her marvellously weird-like beauty, and her husband cannot remove his rapt gaze from her. But presently a single turn of his head changes his glance of admiration into one of surprise and anger. In the shade of a gigantic azalea he spies Captain Walter Reeves, standing in an attitude of calm listening enjoyment. Instantly the Admiral's eye flashes with indignation. How dares Walter Reeves to be here, in his wife's drawing-room, when he ought to be miles away out on the stormy seas ?

In an instant the offender is called out of the room, and Sir Herbert demands to know why he has disobeyed orders by staying on shore.

'I have had no orders to weigh anchor, Sir Herbert.'

'Perhaps the order is still lying on your cabin table ; it was issued at ten o'clock this morning.'

'No despatch has reached the *Leo*, for I've been on board all day, Sir Herbert, and came direct to Government House.'

'Very strange, very ! There must be some terrible mistake in the matter. Is Mr Grey here to-night ?'

'No, Sir Herbert.'

'I must see him at once. The subject admits of no delay.'

'Shall I go to North Street, and fetch him here ?'

The Admiral pauses for a moment, and takes a survey of Walter from head to foot. He notes the velvet suit, the delicate lace ruffles, the *Montero* cap, the large plume of feathers, the dark cloak set so jauntily on his shoulder, the thin shining shoes, and the huge glittering buckles ; and a *souçon* of contempt glances from his eyes, a slight sneer trembles on his lip. 'I think I am more fitted to brave the storm than you are to-night, so I'll go to Mr Grey myself.' Then without another word, he walks down the stairs, and passes out into the wind and rain. The house in North Street is closed for the night, and Mrs Grey and Helen are sleeping the sleep of the quiet-minded. Only the master of the house is still up, and he is finishing a cigar in his library. He starts up in alarm when he hears the authoritative knock at the door, and visions of fire and thieves start up before him. His alarm is in no whit lessened when he sees his august son-in-law on the steps.

'Sir Herbert ! Who would have thought of seeing you so late ! Is anything wrong ? Is Katie ill ?'

'No ; your daughter is quite well. I left her just now dressed up like some medieval heroine, and lamenting her woes in song.'

'True ; I recollect this is the night of Katie's charade party.'

'They have both gone into the library now ; Mr Grey has flung the stump of his cigar aside, and the Admiral speedily explains the cause of his late visit.

'I acted as your note directed, Sir Herbert, and at once sent off the *Leoni* to assist the *Daring*.'

'The *Leoni* ! Were you mad, Grey ?'

'I confess your order amazed me. I did all I could to consult with you about it, but you were gone to Hillview. Here is the order ; you will see the *Leoni*'s name written plainly.'

The Admiral takes the paper in his hand, holds it near his gaze, scrutinises it afar off, glances at it through his eye-glass ; but the fact is indisputable—there is the word *Leoni*, apparently in his own writing.

'This is a vile forgery, Grey ! I never wrote that, never dreamt of giving such a mad order. Heaven alone knows what results, what complications may arise from it ! I shudder to think of the *Daring* still aground on the Short Reefs, or perhaps altogether broken up long ere this.'

'The *Leoni* couldn't help her much, I fear.'

'Help her ! She'll never reach her. I should not be surprised if she were a wreck herself by this time ; a hideous, top-heavy, unmanageable craft like that couldn't take care even of herself in such a storm.'

'What had better be done now, Sir Herbert ?'

'Despatch the *Leo* at once ; though I fear her services will come too late.'

Practical discussions follow, that keep the Admiral and his secretary employed for some time longer. When Sir Herbert returns home, it is

no vain excuse that makes him retire to his room in very weariness of spirit, very fatigue of body. He finds Walter Reeves is already gone away; but some of the guests are still lingering in the rooms, trying to prolong their amusements to the last minute.

CHAPTER XIII.—CONFESSION.

The storm has spent itself before the next morning. Katie can see that, as she listlessly looks out of the bay-window of the breakfast-room. One would hardly suppose the treacherous gale had been holding such wild revels the night before. The tossing waves that had leaped with frothy crests over the serrated rocks of the Short Reefs, are placid enough now—dancing perhaps over those who went down a few hours before into the cruel depths. Lady Dillworth has a headache; she listens calmly to Liddy, who blushing and blooming, pours forth her rose-coloured confidences, and swallows her coffee between whiles. Hunter is helping the groom to carry her boxes down-stairs; and Miss Delmere, with only a few minutes to spare, is selfish in the exuberance of her joy, and cannot see the dark circles round Katie's sleepless eyes nor note the deep sadness of her looks. At length she goes away, and the Admiral enters the room.

'You are just in time, Herbert; Hunter has brought up some fresh coffee.'

'None for me, thank you. I knew you would be engaged with Miss Delmere; and as I had papers to examine, I had my breakfast brought to the library.'

'Liddy is gone away now.'

'Yes; I met her in the hall, and saw her into the carriage. I've brought you the newspaper, Katie; you will see the wreck of the unfortunate ship I told you of yesterday.'

'The *Daring*! Is she wrecked?' Katie takes the paper into her trembling hands, but cannot read a word for the throbbing of her brows and the dizziness of her eyes.

Her husband goes on: 'Yes; she went to pieces in the gale, and every soul on board would have gone down with her had not a merchant-ship passed by the merest chance. Twenty-three men are lost. At least they went away in the *Daring's* large cutter; but no boat could have lived out the storm.'

'How dreadful!' Katie starts at the sound of her own voice, it is so deep and hoarse.

'Dreadful indeed! What makes the matter worse is, that in all human probability every man might have been saved and the ship also, had not an atrociously wrong act been perpetrated.'

Katie hears a rustle of paper; she knows by instinct what is coming, but she dares not lift her head.

The Admiral goes on in an agitated tone: 'Some one has tampered with my papers, has even dared to meddle with my orders. I directed the *Leo* to be sent out at once to the scene of the wreck; but from malignity or some other motive, the name *Leoni* was substituted.'

'Wouldn't that ship do as well, Herbert?'

'Certainly not. She would never reach the Short Reefs in such a gale. I fully suspect she's foundered at sea or gone on the rocks herself. I'll find out who did it! If I thought Reeves, or

any one else at his instigation, had been guilty, I'd, I'd'—

There is no saying how the sentence might have ended. Katie has risen from her seat, and stands before her husband trembling.

'I did it, Herbert! I altered your order!'

'You, Katie!—you, my wife!'

'Yes; but I never thought my silly act would lead to such misfortune.'

'What was your motive, Kate? Surely you could not have wished to injure me? To set me up as a mark of inefficiency and ridicule?'

'O no; a thousand times no. But Captain Reeves was helping me to get up our charade, and I altered the ship's name that he might not have to go away.' Here Lady Dillworth's voice fails her. She cannot utter another word, so choked and gasping is her breath; the bare blank sentence remains as it was: 'I altered the ship's name that he might not have to go away.'

The Admiral does not reply. There is a stillness in the room, as though some one had died there. A burst of passion, an angry storm of words would be a relief; and Katie glances up in alarm to see her husband looking down sadly at her. He is pale as death; his lips are set and firm; a dim haze has clouded his eyes, as though unshed tears are springing there; but there is no sign of resentment in his face—only pity, a tender, touching, tremulous pity, an infinite yearning for something gone, a regret, sorrowful and deep! Yet all so mixed with intense love, that Katie knows for the first time in her life what passionate boundless strength there is in his affection for her. A sudden understanding of how dear she is to him dawns upon her; she feels he would give his very life for her.

Katie would have flown to his arms, and told him his love is fully returned, that at last she feels his worth and goodness; she would have fallen at his feet and there have craved for pardon; but he puts her gently yet firmly away.

'My poor, poor Katie! Have I then spoiled your young life? I might have suspected this; but I was blind and selfish. Forgive me, my poor child, forgive me! I would give worlds to restore you your freedom again!'

Ere Katie has fully grasped the meaning of his words, he has gone out of the room; she hears him walk rapidly down the stairs and out of the house. A sense of numbness creeps over her; she sits for a while like one stunned. How long she remains crouching on the sofa she never knows; a whole lifetime of anguish seems crushed into that space. All the brightness of youth appears to die out at her husband's departure; his retreating footstep sounds like a knell of departed hope.

After a time, Lady Dillworth rouses herself; even sorrow cannot endure for ever. She recollects it is near the hour for luncheon, and then Herbert will come home. She dresses herself in the robes she had on when he made her the offer of marriage. Why she has done this, she does not confess even to herself; but perhaps she imagines old associations may soften present misunderstandings. She goes down to the dining-room and waits. The table is laid for luncheon, and the bright fire glitters on the silver and glasses and flowers. All is so pleasant and cheerful and homelike! And even then a thrill of satisfaction comes over her

that now Liddy Delmere is gone she will be able to devote all her time to her husband—have him all to herself. But the luncheon hour passes, and then the door opens and Hunter enters with a letter on a salver. The address is written in a rapid unsteady hand, as though the fingers trembled. She sees it is Sir Herbert's writing, and tears open the envelope with a sense of impending trouble, that blanches her cheeks and chills her heart. The words run thus:

'No one shall ever know you did the mischief, my poor Katie; the blame shall rest on me alone, and I will bear it willingly for your sake. But my professional career is over; men will never again trust my judgment or deem me fit to command. I was proud of my standing in the service and of an untarnished reputation; but you have spoiled it all, merely to enjoy a short interval more of Walter Reeves's society. Why did you not tell me he was so dear to you? You should have said before we married I could never make you happy. Yet I will not blame you, my poor wife. My own selfish blindness has caused all this misery. Before this letter reaches you, I shall be on my way to London to resign my appointment.'

This was all! But the contents fell like a blow on her heart. Katie sits alone in that quiet room while the iron pierces her soul. The untasted luncheon stands on the table till the fire goes out and the shades of night gather round. Then Hunter knocks at the door in alarm, to know if 'my Lady' will have the things removed. Katie rouses herself to tell him that while his master is away she will henceforth have her meals laid in her boudoir, and that she will receive no visitors in Sir Herbert's absence.

Hunter sees her pallid face and tear-stained eyes, and draws his own conclusions, and thinks things 'never went on like that in the first Lady Dillworth's time, anyhow.'

THE GUACHO.

'WILL you ride over with me to the neighbouring village?' asked my friend Senhor Pedro da Silva. 'There is a *festa* there to-day. And as you are a stranger in the country, you will see some feats of horsemanship quite as clever as can be shewn in the circus rings of old England.'

'With the greatest pleasure,' I replied. 'I have often heard of the wonderful horsemen called Guachos, and desire much to see if the accounts are really true.'

'I think you will not be disappointed. He and his horse are one; sometimes he acts as its tyrant, but more frequently they are friends. From infancy they have scoured over the immense Pampas of South America, frequently amidst violent storms of thunder, wind, and rain. His address and grace on horseback yield neither to your best fox-hunters nor to the American Indian. But here is Antonio with our steeds; let us mount.'

An hour's ride over the dull arid plains of Buenos Ayres, covered with the grass now so much cultivated in our gardens, and admired for its light feathery tufts waving in the wind, brought us to San Joachim, where the people were already collecting in their holiday attire, and exchanging friendly greetings on all sides. The gay striking dresses of the Guachos mingled in every group.

The *poncho* or mantle of cloth, woven in bright coloured stripes, has a hole in the centre through which the head is passed, and falls down to the hips in graceful folds. The nether garment is a combination of bedgown and trousers, bordered by a fringe or even rich lace on these *festa* days, which varies from two to six inches deep according to the wealth of the wearer. Then to-day the great jack-boots of untanned leather are exchanged for the smartest patent leather, with bright scarlet tops, and enormous spurs at the heels. A wide-brimmed Spanish hat is worn, a purple or yellow handkerchief twisted round it; whilst the belt encircling the waist sparkles with the dollars sewn upon it—often the whole fortune of the owner. His weapons are attached to this girdle, consisting of a formidable knife, a lasso, and a bolas, which may not be so familiar to the English reader as the lasso. There are two balls fastened together by short leathern straps, to which another thong is attached, by which it is thrown; this is whirled violently round the head before propulsion, and entangles itself in the legs of the horse or cow to be captured.

But whilst we are gaily chatting to Senhor Pedro's many friends the games are beginning, and we hasten off to the ground. There we find two lines of mounted Guachos, from ten to twenty on each side, just so far apart as to allow a rider to pass between the ranks; all are on the alert and holding the lasso ready for use. One whom they call Massimo, an evident favourite with the crowd, comes tearing along at a gallop and dashes in between the lines. The first horseman in the ranks throws his lasso at Massimo's horse as he flashes past, but misses, amidst the derisive shouts of those around; then the second, quick as lightning casts his; and so on down the ranks. Presently, however, the horse is lassoed and brought to the ground; and the skilful rider alights uninjured on his feet, smoking his cigarette as coolly as when he started from the post. The dexterity and watchfulness of the men, who can throw the lasso so as to entangle the feet of a horse while going at full speed, are simply wonderful. Another and another followed with varying fortunes; sometimes the first struck down the horse and rider, rarely was it that one escaped altogether. The popularity of the famous chief Rosas was said to be founded on his proficiency in this adroit but cruel art, and no man can be their chief who is not the cleverest among them: renown on horseback is the one great virtue that exalts a man in their eyes; cruelty to their favourite animal does not seem to enter into their thoughts!

But at length they weary of this sport, and move off a little way to vary it with another. Now we seem to have moved back a few hundred years, and find a pastime of the middle ages still lingering among these descendants of the Spaniards, who doubtless introduced it into the New World. In those days it was called the game of the quintain. A pole was firmly planted in the ground, with a cross-bar, to which was hung the figure of a misbelieving Saracen, well armed and holding a large sword. The horseman tilted at full gallop against this puppet; and as it moved lightly on a pivot, unless it were well struck in the breast, it revolved, and the sword smote the assailant on the back amidst the laughter of the crowd. Here in

the wild Pampas the trial of skill is greater. A kind of gibbet is erected, to which is hung a finger-ring by a string. The Guacho, instead of the spear of knightly days, holds a weapon more characteristic of his work in the *saladero*, where the cattle are killed and salted—namely, a skewer. One after another the Guachos gallop at full speed and try to push the skewer into the ring and carry it off. Antonio, Luis, and Melito succeeded admirably; but many a novice failed in the difficult task. Still it was a pretty sight, and enjoyed apparently by both horses and men.

Then came the inevitable horse-races, which are of almost daily occurrence, when associates challenge one another, and they strike off in a moment in a straight line until they disappear in the horizon. In this case, however, a wide straight avenue near the village was chosen for a short, rapid, and often renewed race; a pastime for the idle, and the occasion of ruinous bets. The riders were dressed with the greatest elegance; their horses well chosen from the corral, and covered with silver ornaments. The bridle is of the leather of a foal, finely plaited and mounted with silver; stirrup, bit, and spurs of the same metal. A glittering silver belt, sometimes of a flowery pattern, and of colossal proportions, hangs round the breast, and a silver strap across the forehead. The saddle is a wonderful piece of mechanism, forming the Guacho's 'bed by night and chest of drawers by day'; it is very heavy, and consists of ten parts; skins, carpets, and cow-hides intermingled with other necessities. Off they go at last from the post, spurring and urging their steeds like modern centaurs, handling them in a manner well worthy of admiration, and with the most perfect elegance. When the winner came in, many a by-stander had lost all his possessions, so mad a race of gamblers are they. As a last resource, they pledge their horse, and expose themselves, if they lose, to the lowest of humiliations—that of going away on foot!

We turned at last towards home, leaving the roystering spirits to finish off their day at the *pulperia*. This is which takes the place of the club, the café, the newsroom, and the home. A cottage, neither more simple nor more luxurious than any other to be found in the Pampas, covered with thatch; the walls of dried mud, or more frequently of rushes sparged with mud; the flooring being of trodden earth; into which the rain penetrates, the sun never enters, and where a hot damp air is the prevailing atmosphere. Before the door stands a row of strong posts, to which the horses of the guests are tied; the new-comer jumps off, and there leaves his steed, saddled and bridled, for many weary hours in the hot sun or pouring rain; whilst he, to use a native expression, 'satisfies his vices' in the *pulperia*. The door is open to all comers, and great outward politeness reigns within; there is a continual exchange of gallantries, to which the Spanish language easily lends itself; but reason soon loses its way, and the strangest bets are offered and taken. Sometimes it is between two friends as to who shall first lose blood; when the whole company sally out, knives are drawn between the duellers, and a combat, often much more ridiculous than valiant, ensues!

The following morning, Senhor Pedro proposed that we should ride out and see the Guacho at

work and in his home. 'You seem to have been interested in him yesterday,' he said, 'and he belongs to a type that is unique. Notwithstanding the hatred of the original inhabitants towards their invaders, the two races were mixed, and these unions produced the Guacho. Look at his tall figure, bony square face embrowned by the sun, and stiff black hair—there you see the Indian; whilst the Spaniard is in his proud haughty manner, in his vanity, and also in his great sobriety. He drinks water and eats his dried meat without bread, not from contempt for better food, but from a horror of work. To earn his daily food is not so much his aim as to get money to bet with. He will go into the *saladero*, where, knife in hand, he will kill, skin, and cut up the cattle for salting, and find enjoyment rather than labour in it. He easily gains in a few hours a wage that suffices; and as soon as it is paid, he jumps on his horse and rides off to the *pulperia* to gamble it away.'

Thus conversing, we reached a hut which could scarcely be surpassed in its misery. Placed alone in the middle of the plain, without any garden or cultivated ground, not a tree to cast a welcome shadow, or a hand to repair the dilapidated walls, it seemed formed to repulse rather than attract the owner. At our approach, the mother came out, surrounded by her children, her complexion approaching the mulatto, for the air of the Pampas quickly destroys the fineness of the skin. It is only in the capital, Buenos Ayres, that handsome Creole types are to be seen, where fine features of an Indian class surpass European beauty, even when the tint is olive. The wife, like the husband, hates work: her only occupation is to boil some water, pour it over maté or tea of Paraguay, and drink it through a metal tube. Her children, at the age of three or four, can sit on horseback and gallop over the plain with no other bridle than a cord passed through the horse's mouth. At six they watch the sheep, and at ten are ready to break in the most spirited colts. Only everything they do must be on horseback: they will neither use their arms nor legs.

'Good-morning, Senorita,' said my friend. 'Where shall we find your husband?'

'He is gone, Senhor, to break in some horses for Senhor Meliso; it is not far from here.'

'So much the better. We will ride on and see him at work.'

We reached the place; and the Guacho came out to meet us.

'Will you shew my friend your feat at the gate?' said Senhor Pedro.

'With the greatest pleasure,' answered the flattered Guacho. He jumped on to the top transverse bar which forms the gate of the corral, and calling to another man to open the lower ones and drive out a troop of horses at full gallop, he, with the most astonishing skill, singled one out with his eye, dropped down on to it, and rode off without saddle or bridle at the top of its speed. Soon returning, he proceeded to break a horse that had been previously caught in the plains. The Guacho threw two lassos, one over the neck, the other on the hind-legs. Several men hold the colt tightly whilst he saddles and passes a cord through the mouth of the animal; and when the first paroxysms of fear have passed, the tamer jumps on, and pressing his powerful knees into its

sides, the lasso is withdrawn. The horse and rider then start on a furious course, from which they both return exhausted, in the midst of the *vivats* which resound from every side. All that is now required is for the breaker to ride ten or fifteen leagues, when he gives up the horse to the owner and receives his fee. They are never taught to trot, but have an easy movement; and a man has been known to ride two hundred miles a day without fatigue, and living only on dried meat and maté.

THE GERM THEORY AGAIN.

WE have on several occasions alluded to the Germ theory, by which is meant the theory that invisible germs capable of producing animalculæ and of spreading disease are constantly floating in the atmosphere—and that the more impure the air the greater are the number of these germs. We revert to the subject, because it is debated in all quarters, and it is as well that our readers should know something of what is causing so much controversy. Some surgeons distinguished as operators are great believers in the Germ theory; so much so, that before beginning, for instance, to cut off a leg, they cause a certain germ-killing liquid to shower like spray near the part operated on; by which, as is alleged, the wound is kept free of anything noxious. Whether there be germs or not, the use of disinfectants in the air is said to be beneficial. Notably the celebrated carbolic-acid plan of Professor Lister has met with marked success, and is practised by the greatest surgeons of our time. But though the air certainly contains something which favours decomposition, it is by no means yet proved that that something is made up of germs.

Professor Tyndall has been the principal advocate of the Germ theory, and has written some papers strongly in its favour. Professor Bastian takes an opposite opinion. He thinks that living organisms may originate in disease by spontaneous generation. His notions are that if germs are continually floating about in the air, they would drop everywhere and anywhere alike. This argument applies more forcibly to the fact which Dr Bastian discovered—namely, that he was able to get life in flasks containing inorganic solutions, but that he always failed if such solutions were not made up of salts containing oxygen, hydrogen, carbon, and nitrogen; that is to say, of the elements of life. If the organisms are really the result of a molecular arrangement of the 'mother-liquid,' we should expect to find them only in those fluids which already contain the elements necessary for their composition. Three speculations are involved in these experiments: on the one hand, that low forms of life do occasionally arise by spontaneous generation; on the other hand, either that the heat which is usually considered destructive of life and germinating power is in reality nothing of the kind; or that Dr Bastian's experiments were incorrectly performed.

Since the publication of Dr Bastian's observations, a very lively controversy has been carried on in scientific quarters between the supporters of the germ theory and of the theory of spontaneous generation. Dr Bastian's work was conducted with great care and in the presence of some distin-

guished authorities. Dr Sanderson, on the other hand, found that upon increasing the heat which is applied to the flasks, no organisms were produced; but until we have reason to doubt the generally received opinion as to the amount of heat necessary to destroy life, this result may be equally well explained according to either of the two theories.

Dr Bastian insists that the organic solutions in his own flasks are not found by him to undergo putrefaction where every precaution is taken for withholding the entrance of air. Thus a simple piece of cotton-wool, which acts as a kind of sieve, will when placed in the mouth of a flask prevent decomposition. Professor Tyndall has invented the most ingenious contrivances for illustrating his views. In one case he employed a chamber the walls of which were covered by a sticky substance. The particles of dust in the air were allowed to collect and adhere to the sides, and the air in the vessel, as shewn by its non-reflection of a beam of light, was rendered comparatively dustless. Flasks were now introduced, and they remained for a long period free from organisms. On repeating some of these experiments this year, however, Professor Tyndall found that many of the infusions which had previously been preserved from putrefaction with ease, were now found, when placed under the same conditions, to swarm with life. Still he refused to believe in 'spontaneous generation,' and preferred to consider that the production of life in his flasks was due to some fault in his experiments, and that the air of the Royal Institution was not so pure this year as it was last. Instead, therefore, of introducing his fluids by means of an open pipette, as he had previously done, he now made use of a 'separating funnel,' and by this means the fluids found their way into the flasks without exposure to the air. The result of these precautions was that no organisms appeared. The objection, however, that we have to find is, that no guarantee can be given that will enable us to ascertain whether the air is really free from particles of organic matter or not. Last year the air was considered to be pure because moteless; but this year, though moteless, it was found to be impure.

Professor Tyndall and his friends are so exceedingly confident in the power of the germs of the atmosphere, that they attribute to their influence every known case of putrefaction; and they do so because they believe that they have proved that whenever the air can be excluded from a putrescible fluid, putrefaction will not take place. But Dr Bastian has succeeded in producing life out of organic infusions from which the air has been excluded, and which have been previously raised by him to temperatures hitherto considered by scientific authority as fatal to life. Thus the question resolves itself into this: What is the exact point of heat which kills the germs of bacteria? At present we do not know, and we have therefore no right to make any supposition upon this point in favour of either of the two theories.

Since Dr Bastian's experiments were first made public, the holders of the Germ theory have gradually raised what we may call the thermal death-point of bacteria, in order to explain away the results of his experiments by the light of their own theory. If Dr Bastian's fluids did develop life,

they say, the germs must have entered into them by some means or other; and if he superheated these fluids, the fact of the germs surviving the process shews that they must be possessed of greater enduring power than we have given them credit for.

Curiously enough, Professor Tyndall declares that frequent applications of a low degree of heat, and applied at intervals, have a far greater 'sterilising effect' than a single application of a high temperature. For a given fluid may contain germs of all ages. If such a fluid be boiled for a considerable time, all the germs of recent formation will be killed; but those of a greater age will merely be softened, but still capable of reanimation. If, however, the fluid be heated for a short time only, the recent germs will be destroyed, while an older crop will be liberated. A second application of heat destroys this second crop, and brings a third into play. Further heat will awaken successive crops, until at length a point is reached when the toughest germ must yield. This is certainly a most ingenious explanation of the difficulty.

A very interesting contribution to this subject has lately been made, by Dr Bastian and others; and we will now briefly describe the main results of their researches. It has long been known that slightly alkaline organic fluids are more difficult to sterilise than those which are slightly acid. Pasteur the French chemist says that animal water in its normally acid state becomes sterile at one hundred degrees centigrade; but that if the infusion is first rendered alkaline by the addition of potash, the application of a little more heat is necessary, in order to insure sterility. If we bear in mind the two theories, we shall see that these observations of Pasteur may be explained according to either of them. We may believe that the germs in the infusion are fortified against the destructive action of heat by liquor potassæ; or on the other hand, we may hold that the spontaneous generation of organisms is favoured by the presence of an alkali. Acting upon these data, Dr Bastian heated a similar fluid in its acid condition to the temperature of one hundred degrees; so that, according to Pasteur, it was now barren. He then added a quantity of potash sufficient to neutralise the acid, the addition of the alkali thus being made *after* instead of before the boiling; and he then allowed the fluid so treated to stand at a temperature of about one hundred and fifteen degrees Fahrenheit. In a short time swarms of bacteria appeared.

Dr Roberts, however, considers that this result was obtained because sufficient precaution had not been taken by Dr Bastian to prevent the entry of germs, which might have been introduced by the potash. Accordingly, he filled a small flask with an ounce of the acid infusion, and then sealed up his potash in a capillary tube. The potash was then heated in oil to two hundred and eighty degrees Fahrenheit, and kept for fifteen minutes. The tube of potash was now introduced into the flask containing the infusion, and the flask was boiled for five minutes, and sealed. The flask was now kept for some time in order to test its sterility. When this was ascertained, the flask was shaken, so that the little tube of potash inside was broken, and the potash was thus allowed to mingle with and neutralise the infusion. The flask was now maintained at a low temperature of one

hundred and fifteen degrees Fahrenheit, and it remained perfectly clear. And so Dr Roberts concludes that liquor potassæ has no power to excite the generation of organisms in a sterilised infusion. Professor Tyndall repeated these experiments with additional precautions, and obtained similar results.

The general conclusion which is drawn from various experiments by the advocates of the Germ theory is, that liquor potassæ has no inherent power to stimulate the production of bacteria, and that any apparent power of this kind which it may seem to possess is due to the presence of germs within it. These germs they consider are not destroyed until the potash has been raised to the temperature of one hundred degrees centigrade if solid, and to one hundred and ten degrees centigrade if liquid. Dr Bastian, who repeated his former experiments with every possible precaution, found no difference in his results. Moreover, he discovered that liquor potassæ, when added in proper quantities, is just as efficacious in stimulating the development of life after it has been heated to one hundred and ten degrees centigrade, as when it has been heated to only one hundred degrees. Pasteur will consequently have to raise the temperature which he considers sufficient to destroy the germs contained in a solution of strong liquor potassæ to a point still higher than one hundred and ten degrees.

But there is still another proof that liquor potassæ if previously heated to one hundred degrees does not induce fermentation in virtue of its germs, because if only one or two drops be added, the infusion will remain as barren as ever; while a few more drops will immediately start the process of fermentation. Now if the potash really induced fermentation because it brought germs along with it, two drops would be quite as efficacious as any other amount. Finally, Dr Bastian has shewn us that an excess of alkali prevents fermentation, and to this fact he attributes the failure of Pasteur to develop life when he employed solid potash. He had added too much of the alkali.

It is impossible to draw any definite conclusion from these as from the other experiments, until we know the precise temperature which is fatal to germinal life. Dr Bastian indeed thinks that he has been able to shew that bacteria and their germs cannot exist at higher temperatures than one hundred and forty degrees Fahrenheit; but his evidence here is not quite conclusive. He does not deny the existence of germs nor their probable influence in producing life; he merely says that his experiments furnish evidence to shew that in some cases organisms may spring into existence without the aid of a parent. The strong points of his case are, that as fast as his adversaries can suggest precautions to insure the destruction of germs, he has been able to shew life under the altered conditions; and that whenever the supposed death-point of bacteria has been raised on account of his experiments, he has succeeded in obtaining life after having submitted his flasks to the required temperatures.

How this most interesting controversy will end, we cannot foretell; but we hope that the further researches of our scientific men upon the subject will ultimately lead to the discovery of the truth. Meanwhile, we observe that Dr Richardson, at the late Sanitary Congress at Leamington, entirely dissented from the theory of germs being

the origin of disease, and characterised it as the wildest and most distant from the phenomena to be explained, ever conceived. As no one contests the fact that pure air is a very important factor in promoting health and averting the insidious approaches of disease, people keeping that in mind need not practically give themselves much concern about germs. See that you draw pure air into the lungs. That is an advice to which no theorist can take exception.

OCEAN-VOYAGES IN SMALL BOATS.

It is perhaps not generally known that adventurous persons occasionally cross the Atlantic from the American coast to England in small boats. The undertaking is dangerous, but is accomplished. Twenty-four years ago, when on board a Cunard steamer, our vessel passed an open sailing-boat containing two men on a voyage from America to Europe. They had no means for taking an observation, but trusted to fall in with large ships, from which they would get information as to where they were. On sighting them, our captain knew what they wanted, and hung out a black board on which were inscribed in chalk the latitude and longitude. This was satisfactory, and on they went on their perilous expedition. What came of them we know not. We were told that men who run risks of this kind, and who happen not to procure information as to their whereabouts, are apt to make strange mistakes in their voyage to England; such, for instance, as running on the coast of Spain instead of the British Islands—the whole thing a curious instance of reckless daring.

Small vessels, possibly better provided, have made runs which have attracted the admiring attention of nautical men, for the exceptional circumstances under which they occurred, but without reference to competition or bonus. In 1859 three Cornish fishermen, in a fishing-boat of small tonnage, sailed from Newlyn near Penzance to the Cape of Good Hope, and thence across the Indian Ocean to Melbourne, where they arrived 'all well.' We do not find the actual tonnage named. In 1866 a small yacht of twenty-five tons, hailing from Dublin, set out from Liverpool, and safely reached New South Wales after a run of a hundred and thirty days. The distance was set down at sixteen thousand miles. It was regarded, and justly regarded, as a bold adventure in 1874, when a schooner of only fifty-four tons safely brought over a cargo of deals from St Johns, New Brunswick, to Dublin, with but seven hands to manage the craft.

Boat-voyages, however, are evidently more remarkable than those of clippers, yachts, and schooners; on account of the extremely small dimensions of the craft which have ventured to brave the perils of the ocean, and of the paucity of hands to manage the sails and helm during a period measured by months—under privations of various kinds.

Eleven years ago the Americans gave an indication of spirit and pluck in the conception and fulfilment of a very bold enterprise. Mr Hudson, the owner of a small craft named the *Red White and Blue*, fitted it up for an ocean-trip to England. It was a life-boat, built of galvanised iron, only twenty-six feet in length, six feet in breadth of beam, and three feet deep from deck to hold.

Small as it was, the *Red White and Blue* carried what sailors call a very cloud of canvas; it had mainsail, spritsails, staysails, courses, topsails, royals, top-gallants, sternsails, trysails, three masts, bowsprit, booms, yards, gaffs, jib-boom, yard-tops, cross jack yards, spankers, and all the rest of it—an enormous amount of furniture, one would think, for so small a house. The boat was sharp at both ends, had water-tight compartments lengthwise and transverse, and safety-valves which would enable her to right herself in a few minutes if flooded. There was a tiny cockpit for the steersman near the mizzen-mast, in which he sat somewhat in the same position as Mr Macgregor in his *Rob Roy* canoe. The air-cylinders at each end of the boat and along the sides, customary in life-boats, assisted in maintaining the buoyancy and upright position. It is amusing to read of a mainmast only seven feet high and a bowsprit of two feet in length; but the juvenile ship was proportionate in all these matters, and bravely she looked, a plucky handsome little craft.

The crew of the *Red White and Blue* was as exceptional as the boat itself. The owner, Captain John M. Hudson, took the command; Mr Frank E. Fitch acted as mate; while in lieu of petty officers, able seamen, and ordinary seamen was a dog named 'Fanny.' On the 9th of July 1866 the pigmy ship took farewell of Sandy Hook, near New York, on a voyage of unknown duration and uncertain vicissitude. At midnight on the 18th the boat struck against something hard and solid, but fortunately without receiving much damage. They sailed on till the 5th of August, when they fell in with the brig *Princess Royal*, hailing from Yarmouth, and obtained a bottle of rum, two newspapers (very precious to the wayfarers), and a signal-lamp. Narrowly escaping a complete overturn on the 8th, they spoke with the barque *Welle Merryman*, from which they obtained two bottles of brandy. After another peril of capsizing, they at length sighted English land, the Bill of Portland, on the 14th. Beating up the Channel, the boat entered Margate Harbour on the 16th, after being thirty-seven days at sea. The little craft created no small astonishment at Margate. As there was no chronometer on board, the calculations of distance, direction, &c. had to be made by compass, line, and dead-reckoning. So little opportunity had there been of obtaining a fire, that the food (mostly preserved in air-tight tins) had to be eaten cold. The original store of a hundred and twenty gallons of water supplied their wants with this essential requisite. Poor Fanny the dog did not at all relish the voyage; constant exposure to the weather so weakened her that she died soon after reaching Margate. When the *Red White and Blue* was afterwards exhibited at the Crystal Palace, a little incredulity was expressed as to the reality of the voyage; but as the names of the vessels spoken with were given and the dates of meeting, there seems no reason to doubt the faithfulness of the narrative. The two navigators, however, did not return to America in the same way; they had 'had enough of it.'

A still bolder achievement, in so far as the number of the crew was concerned, was that of Alfred Johnson, who in June 1876 started from America in a small boat manned only by himself. Quitting the port of Gloucester, Massachusetts, on the 15th, he had fine weather for a time, but

then experienced some of the peril of Atlantic voyaging under exceptional circumstances. Fogs and head winds compelled him to put into Shake Harbour, where he had his compass corrected. Starting again on the 25th, he experienced tolerably fair weather until the 7th of July, when a heavy gale set in from the south-west. The combings of the hatchway were started, and the water, finding entrance, damaged some of his provisions. The gale subsiding, he was favoured with fine weather and fair wind until the 16th; and a strong breeze in the right direction coming on, he made good progress till the 2d of August. When about three hundred miles from the Irish coast, the wind increased to a hurricane; he hove to, but in unshipping his mast for this purpose, the boat got broadside on a large wave and was upset. Johnson clambered on the upturned bottom, where he remained for about twenty minutes. By dexterous management he succeeded in righting the boat, got in, and pumped it dry; everything, however, was wetted by the upset, and he lost his square-sail and kerosene lamp.

Wending his way as winds permitted, he reached within a hundred miles of the Irish coast by the 7th, spoke a ship, and obtained some bread and fresh water—both of which had become very scanty with him. On the following day he got soundings, but fog prevented him from seeing land. On the 10th he sighted Milford, near the south-west extremity of Wales. He landed at Abercastle in Pembrokeshire on the 11th, after being fifty-seven days at sea; starting again, he put into Holyhead, and finally arrived at Liverpool on the 21st. The little *Centennial*, which measured only twenty feet in length over all, had run about seventy miles a day on an average. Johnson maintained his general health excellently well, though suffering from want of sleep.

The little boat that has recently crossed the Atlantic differed from Johnson's in this among other particulars, that it had a crew of two persons, one of whom was a woman. Certainly this woman will have something to talk about for the rest of her life: seeing that we may safely assign to her a position such as her sex has never before occupied—that of having managed half the navigation of a little ocean-craft for some three thousand miles. The *New Bedford*, so designated after the town of the same name in Massachusetts (the state from which Johnson also hailed), is only twenty feet long, with a burden of a little over a ton and a half; built of cedar, and rigged as (in sailor-phrase) a 'leg-of-mutton schooner;' with two masts and one anchor. Anything less ocean-like we can hardly conceive. Captain Thomas Crapo, the owner of this little affair, is an active man in the prime of life; and his better-half proves herself worthy to be the helpmate of such a man. On the 28th of May in the present year, Captain and Mrs Crapo embarked in their tiny ocean-boat, provided with such provisions and stores as they could stow away under the deck. The steersman (or steers-woman) sat in a sunken recess near the stern, with head and bust above the level of the deck; the other took any standing-place that he could get for managing the sails, rope, anchor, &c. The boat had no chronometer; and the progress had to be measured as best it could by dead-reckoning.

The boat, soon after leaving New Bedford, was forced by stress of weather to seek a few days'

shelter at Chatham, a small port in the same state. Hoisting sail again on the 2d of June, the boat set off with a fair wind; and all went well for three days. An adverse wind then sprang up, a fog overspread the sky, and for ten days the voyage continued under these unfavourable circumstances. Whilst near the shoal known as the Great Banks, a keg was seen floating; this was secured, and the iron hoops utilised (with the aid of canvas) in making a drogue—one which was included among the outfit of the boat being found too light for its purpose. The boat, after lying to for three or four days in a gale of wind, started again, and sailed on till the 21st of June, when another gale necessitated another stoppage. The *New Bedford* sighted the steamer *Batavia*, which offered to take the lonely pair of navigators on board: an offer kindly appreciated, but courteously declined. After this meeting, a succession of gales was encountered, and the rudder broke; a spare oar was made to act as a substitute. The sea ran so very high that even when lying down to rest, husband and wife had to lie on wet clothes, everything on board being sloppy and half saturated. At one portion of this trying period Captain Crapo had to steer for seventy hours uninterruptedly, his wife being incapacitated from rendering the aid which was her wont; and on another occasion he had to pay eighteen hours' close attention to the drogue. The voyage terminated on the 21st of July, after a duration of fifty-four days. The average sleep of the captain did not exceed four hours a day; and he had no sleep at all during the last seventy hours of the run. He had intended to make Falmouth his port of arrival, but was glad to make for Penzance instead.

The surname of Crapo, we were informed by the captain, is not uncommon at New Bedford. The goodwife is Swedish by descent, Scotch by birth, American by marriage—a citizen of the world. In examining the boat closely (which we have done), it becomes more than ever a marvel how it could have formed the home of a married couple for seven weeks. Descending through a small hatchway, the feet rest on the floor of (let us say) the state-cabin, an apartment three feet high; consequently the head and body project above the hatchway. By spreading blankets and rugs, and crouching down by degrees, a would-be sleeper can lie down under the deck, or two sleepers close to the two sides of the boat. The wife of course acted as stewardess, cook, parlour-maid, scullery-maid, &c., leaving her husband to manage most of the navigation. The sperm-oil lamp for the compass-binnacle; the kerosene or petroleum lamp for the cooking-stove; the receptacles for biscuit and preserved meats and vegetables; the butler's pantry for a few bottles of spirits; the vessels for containing water—all were packed into a marvellously small space. The drogue (already mentioned) is a kind of floating anchor which, dragged after the vessel by means of a long rope, helps to steady it in certain states of the wind. Five hundred pounds weight of stores and six hundred of iron ballast, kept the boat sufficiently low in the water.

Such were the interior arrangements of one of those strange small vessels which adventurously attempt to cross the Atlantic.

PRICE 1½d.

EXPERIENCES OF A KNOCKER-UP.

SOME time ago, while paying a professional visit at the house of a small tradesman in the town of B—, in the north of England, I made the acquaintance of an interesting old woman, who upon the occasion in question was nursing the tradesman's wife. There are persons, especially of the gentler sex, who will not be said Nay in their attempts to win your confidence; and such was Mrs Waters, the old lady whom I have named. We became intimate in a few minutes; and circumstances causing me to prolong my visit for several hours, I left the house as familiar with the dame's history as if I had known her for many years.

I have styled her an interesting woman. So she was. Her appearance, I grant, was not attractive. She bore no trace of beauty; neither had she refinement either of speech or manner, being somewhat brusque and hasty both in word and action; yet there was an irresistible power in the rapid glance of her large bright eyes; and although at first you might be led to believe, from the hastiness which marked all her movements as she attended to the requirements of the house and family, that she must be harsh and unfeeling in her disposition, she was really one of the kindest and most tender-hearted of women. I soon found out that she was a neighbour, and that she possessed independent means, which she had acquired by her own unaided industry; that she had also maintained an invalid husband for years, and had educated and given a profession to her only son and child.

I resolved to become better acquainted with the old dame; and as I did not scruple to put questions, I gleaned from her what shall form the subject of the present paper. Her designation as a 'knocker-up' will become plain as I proceed. In reply to an inquiry she said: 'O dear, no! I am not unwilling to tell you how I made my independency. Why should I be? An honest woman need not be afraid of anything. I made it, sir, by knocking-up; every

penny of it. Ay, you may well look surprised, for I fancy you don't know what knocking-up is; or if you do, you are wondering how I could save a fortune out of such a line of action. No; I don't mean to say that I had no other way of making money. I started a shop after I began to knock up; but every penny I made by shop-keeping was spent in keeping my family; and when my son was put to business, some of my otherwise-made money went along with it; but every penny which I put by, and the income on which I now live, was got by knocking-up.

'You may well ask how I, a woman, should ever have thought of such a means of living, or should have ventured upon it. Well, to tell the truth, I never thought of it; that is, I did not invent it; it was brought before me; and I was in too great need to be very nice. I believe I was near the first, if not the very first who earned money by regularly knocking up; at any rate I knew of none who were in that line. The thing was brought about in this way. My husband was a delicate man from our first acquaintance. And he was, bless you! as different from me in spirit and ways as a summer day is from a winter day. He had hardly a morsel of *fend* in him. I've often wondered what we should have done, or what would have become of us, had it been I that had been laid up instead of him. But you see, sir, Providence had a hand in the matter. It was well in many ways, I may say in all ways, that he was afflicted; for you see had it been *me*, what an ill-tempered impatient creature I should have been.

'Was it an illness that fell upon him which laid him aside, do you ask? No; not exactly; I'll tell you. We had been married about six years, and our son was about four years old, when Waters happened on a misfortune; he was in the act of lifting a heavy weight in the foundry in which he worked, when something snapped or gave way in his back. He was brought home between two men; and from that day until his death, more than fifteen years afterwards, he never did a stroke of work. Poor fellow!

'Yes; you're right; the knocking-up scheme followed. It was very singular. I had been down to the foundry one Friday evening for the bit of pay which the masters kindly allowed him for a while, when I got into conversation with one of the better sort of men who were employed in the works. I said to him that I believed I should have the home to keep over our heads, and that I was willing to do anything that would help therein, when he said quite suddenly like: "If you will knock me up at three o'clock every morning but Sunday, I will give you half-a-crown a week." At first I thought he was joking; but when I saw that he was sincere, I closed in with the offer; for something said within me that that would be the beginning of something better still.

The reason why knocking-up is so widespread nowadays is this: people soon get so used to the alarm-clock that it fails to awake them, or if it awake them, they are at times so sleepy that they drop off again before the alarm runs out. This was the case with the person who asked me to awaken him; he had lost many mornings through over-sleeping the time. He was in the designing line; and he said he got more work done and of a better sort during the quiet hours of morning than at any other time. At anyrate this was his statement, though afterwards another reason was assigned for his habit; so he was anxious to be up at three o'clock. Well, I engaged with him; and a good thing it was for me, for before a year had gone over my head I had thirty customers of the like kind. No; not for the same hour in the morning, nor for the like pay—begging your pardon—but mostly for the time between five and six o'clock.

'I have no objection whatever to tell you what I used to earn; why should I? But let me tell you first how I went on adding to my business, if I may call it a business. At the end of the first year, as I have said, I had thirty customers. Year by year they went on increasing, until at the end of five years I had near eighty houses to go to; and for the thirty years that I followed knocking-up after that—thirty-five in all—I never fell below that number. Sometimes I had as many as ninety-five. What did they pay? All prices. When I got a few more early customers in addition to my first one, I knocked him a shilling a week off; for I could not fashion to take half-a-crown. So all who were knocked up before four o'clock paid me eightpence a week; those who had to be awakened soon after four gave me a shilling a week; whilst those who had to be aroused from five to six o'clock paid from sixpence to threepence weekly, according to time and distance. Of course the greater number of customers belonged to the threepenny class.

'You can't see how I managed to get through so large a number of houses in so short a time? But I did, at anyrate. I found system to be a needed thing, you may be sure. Then I found out near cuts to different neighbourhoods. And I took care not to let the grass grow under my feet. Besides, I fancy I had a knack of rousing my employers in a short time. Perhaps my knock or ring or way of tapping was more effective than that of other knockers-up. However that may be, I got through my engagements morning by morning. I see you are eager to get at my weekly earnings. Well, I'll keep you no longer in suspense. For

thirty years I never earned less than thirty shillings a week; mostly thirty-five; and when I had a good lot of far-away or very early customers, I picked up as high as forty shillings in a week. You stare; but what I say is true. Two pounds a week for summoning folks to their work, of a morning.

'I am not a very strong or healthy body now; how can a woman of seventy years expect to be without ache or pain after a life like mine? But for thirty-five years wherein I followed the knocking-up line I never had what may be called a badly day. Bless you, sir, I hadn't time to be laid up! I believe my early rising, and the exercise in the open air, kept me in health; and when bits of cold got hold of me, why, my spirits did much towards helping them off again. Spirit, sir, is everything! Did I go to bed during the day? Never! I could not afford the time; for I had my shop to mind. You look surprised; but I told you at the beginning that I kept a shop. See you; I did not know how long my husband might linger; and then I was so wrapped up in my poor lad, that I determined he should be a doctor or a lawyer, or something smarter than a tradesman; so, having a good long day before me, I resolved upon opening a shop of some kind.

'I was a time in deciding on what I should deal in. I dreaded giving credit; and as there are some things which women are not in the habit of buying on *tick*—somehow they never think of that when they really want them—I resolved to deal in them. So I hit upon selling black-lead, blacking, brushes of various kinds, even pots and pans; for I noticed that when a woman sent for such things she sent the money for them. Besides, I saw that a matter of ten pounds or so would start me in that line; I saw that there would be little perishable stock or articles that would go out of fashion; nor would the business call for a deal of learning or knowledge to manage it—things which I had not; so into that line I went.

'At first I managed to make my cottage do for my shop; the bedroom and cellar I made into the warehouse; then as the trade increased I took the house next to the one I had, and made it into shop and warehouse. Rent and taxes, you know, were not heavy items. I began this business after I had done knocking-up about five years, and ended it about six years ago.

'No; I did not give up because I was tired of work. But I saw that I had enough to live upon, and' (here her voice fell into a low key, and assumed a plaintive tone) 'I had no one belonging me to live for; for my husband had been long dead, and my poor son had been taken from me. Did I sell my business? No; I did not sell either business. There was a poor man, a neighbour, who fell out of work; and as he had a large family, and was running from bad to worse at his shop every week, I just handed over the knocking-up to him; and a good thing it has been for him, you may be sure. And as for the other concern, why, I just let my customers spread themselves among other shops as they thought fit.

'Did I make many bad debts in the knocking-up business? Not many; less than you would suppose. But for one thing, I looked pretty sharp after my money. It took some gathering in,

though. I got paid mostly on a Saturday afternoon and night. Some called and paid me as they passed my house; others left it with those appointed by me to receive it. One way or other, I got most of it week by week. To those who began to be dilatory in paying me, I just gave a hint that if they did not pay up that week-end I would let them overlie themselves a morning now and again. This put them into fear; for they knew they would lose a deal more by being 'quartered' once at the mill than they had to pay me for a whole week's knocking-up. So I had few who did not pay up old scores. Of course I leave out of account some I did not care to press for payment—men with large families, or men who had had a fit of sickness or the like, or a poor delicate woman. But let that pass; they might have done the same by me.

'Yes; a knocker-up has a good chance of finding out the tempers of his customers. Bless you! I soon got to know who were surly and who were pleasant folks; who were short-tempered and who had long tempers. You know, when knocking-up began to be a regular trade we used to rap or ring at the doors of our customers. But there were two objections to this way of rousing them: one from the public, the other from the knocker-up. The public complained of being disturbed, especially if sickness was in a house, by our loud rapping or ringing; and the knocker-up soon found out that while he knocked up one who paid him, he knocked up several on each side who did not pay; so we were not long in inventing the fishing-rod-like wands which are now used. Ay indeed, the knocker-up has a wand of office. I was among the first who adopted rods. So now a few taps on the bedroom window, which no one hears but those who should, are sufficient.

'A surly or hot-tempered fellow would growl or knock things about as he came to the window to reply, and his responding rap would sound as peevish as possible; but a good-tempered man, ah it used to be quite pleasant and cheering to get him out of bed; for you could hear from his very tread that he was grateful even, and his reply-tap sounded quite musical; and when he spoke and bade you good-morning, it was really encouraging. I have been inclined at times to knock some men up for nothing, just because it was pleasant to hear them, especially after you had had two or three of the other kind to deal with. I have given over knocking some fellows up for no other reason than that they were sulky or angry at being disturbed. There was one man in particular: he was a little, slender, ill-featured man, who always reminded me of a weasel; he had to be up at five o'clock; he was given to drink, by the way; so that he was not only hard to awaken, but he never came to the window but he indulged in angry mutterings, and I heard at times an outh slip out of his mouth. He was a shilling-a-week customer, and paid regularly; but I was so plagued by his temper and insulting ways, that at last I gave him up as a bad job.

'You are right, sir; a knocker-up really deserves the gratitude of his customers. They should not think he is compensated when he gets their money. Only think: he has to be out of his warm bed in all weathers; and must not let a bit of tic or tooth-wartch keep him at home. But they can sleep on the night through, in peace and content,

because they are sure to hear his taps on their window at the right time. Really, I'm sure nobody can think a knocker-up is a selfish man, or for that part of it, a selfish woman. Why, no money is so well spent as that which is paid to the profession; and I believe most who pay it think so.

'I knocked up for years two young women who were sisters. They had been left orphans when very young; but poor things, they stuck together, went to the mill, saved their earnings, and at last took and furnished a room. They got me to knock them up; for you see they kept their own little spot clean and tidy, and mended their own things at night; and they went to bed tired and often late; so they slept heavy. Well, as I've said, I knocked them up for years. They would not let me do it for nothing; no, not even now and again. One or the other had always a "Good-morning," or "How are you this morning, Mrs Waters?" in a low kind tone for me. And about once a quarter they would have me spend a Sunday evening with them and take a cup of tea; and if any folks were grateful it was these girls.

'When did I get my sleep, do you ask? I'll tell you. I always went to bed at nine o'clock every night, except Saturday night; and having a tired body and a contented mind, I was not long in dropping asleep. And I was up again at half-past two to the minute; for my first customer lived a good twenty minutes' walk from my house, and you know he had to be awakened at three o'clock. Well, for some time I had no one else to arouse until four o'clock, so I generally came home. Before I went out in winter I got a cup of tea, so I kept the fire in; but in summer I let it go out, and did not care to light it again until I came back from the early customer. Then I always made my poor husband a cup of tea, after which he slept better than in the fore-part of the night. You see he had to awaken me; for being young and very active during the day, I slept soundly. But what between him and the alarm, I never over-slept myself; no, not even once. But after I had been about six or seven years at the job, I got to awaken quite naturally like. It was well I did; for when my husband died, I had no longer him to depend on.

'Yes; the worst weather for a knocker-up is wet weather. Oh, it was trying to one's patience, to say nothing of one's health, to be pelted with rain and wind. Then when the streets were filled with snow-broth it was anything but pleasant. But I always tried to think of the good I was doing. What a wonderful help it was to think that way! Why, I found out that even a chimney-sweep or a sweeper of our streets would be happy in his calling if he only took such a view of his work, instead of comparing it with such as a clergyman's. Why, sir, we are all helping one another as well as earning our livings when we follow our lawful callings. But it was extra nice on a fine spring or summer morning; I used to be happy all over on such mornings.

'You would like me to say something about my son. To tell the truth, sir, I seldom feel willing to talk about him; for when I've been led out to talk about him, my dear lad, it has taken many a day to get his image out of my mind.'

I here besought Mrs Waters not to go on with the story, but she did. It was interesting and touching

in some of its details; but as it would not be relevant to the leading subject of this paper, I refrain from relating it. I heard her tell, both then and afterwards, several incidents of great interest; but as my paper is quite long enough already, I must omit them.

Note.—Since the writer of the above article had his conversations with Mrs Waters, he had a long talk with a civil but illiterate man whom he fell in with during a journey by rail. It came out that he got his living chiefly by knocking-up, having over eighty regular customers, from whom he obtained on an average twenty-eight shillings a week. This was in a town six miles from the scene of Mrs Waters' toils. But like most other money-making avocations, this one has become over-run with competitors, as is evident from the fact that the writer meets in his short early morning walk into the town at least half a dozen knockers-up of both sexes; so that few are now, he believes, so fortunate as either the man above named, or Mrs Waters.

THE ADMIRAL'S SECOND WIFE.

CHAPTER XIV.—THROUGH THE GRIM GATES.

FIVE wretched days pass, and Katie hardly knows how they go, for she counts time only by the arrival of the mail-bag. Yet no letter has come from Sir Herbert, and she is almost distracted. Has he really set her free? cast her off? And will he never again come, or send, or speak?

The great house is growing silent and gloomy beyond measure. Though the daily routine of work and attendance goes on as usual, there is a change, and Katie sees it. Servants are beginning to talk; a rumour spreads among them that the Admiral is to be superseded, and that the establishment in Government House will soon be broken up. Perhaps they have gleaned this from the newspapers, which are making very free with Sir Herbert's name just now. They jest at his clumsiness, his mismanagement, and his blunder; they wonder whether he has fallen into dotage. They marvel how a man in his sober senses could send such a miserable craft as the *Leoni* to sea in a storm. Indeed she would have become a total wreck had not the *Leo* while making for the Short Reefs discovered her far out of her course, tossing about on a cross sea, her rudder broken, her decks flooded with water, and her crew in a rampant state of disorder. The old ship was fast going to her doom, like a great blundering unmanageable sea-monster; when the *Leo* took her in tow and brought her into harbour.

On the evening of this fifth day, Katie watches till the last post comes in, till the last train has stopped, and there is no longer any chance of hearing from or seeing her husband that night. Then her powers of "endurance fail; waiting becomes agony, her punishment seems greater than she can bear. The silence is killing her; she feels as if she must go mad, or die. Her brain throbs so wildly, her mind is in such tumult, that she is hardly responsible for her actions. She rushes up to her room, puts on an outdoor dress, and with her veil

closely drawn over her face, is only conscious she must flee from the house. It is so quiet, so lonely; the very atmosphere suffocates her.

'I will go home to my mother; she will pity me, and calm my burning brow with her cool soft hand,' is her thought, as she almost runs across the hall and out of the door. She never notices the night is cold, that long white icicles are hanging from the trees, and that the ground is hard and frozen. She sees not the stars glittering down at her with their clear holy eyes; nor does she observe the grave questioning looks of the sentries as they notice the Admiral's wife flee out of the gates alone at that late hour.

A strange contrast that silent stealthy departure, to Kate's triumphant entry through those very gates not twelve months ago. Her reign in Government House has been short, its termination sudden and inglorious, for she is doomed never to enter the stately portals again! She walks rapidly on through the streets, shivering, but not from the keen air, for her whole frame is in a burning fever, and the chill breeze feels like a blast from a blazing furnace. Soon Katie is standing on the threshold of the well-known room in the old house, scaring all the inmates with her wan face and wild looks. Mrs Grey is at her side in a moment.

'Katie, my child, what's the matter? Are you ill?'

'Mother, mother! I have come home to you again. Don't send me away, I entreat you. Herbert has left me, deserted me!'

In another moment she is on a stool at her mother's feet, with her face buried in her lap, sobbing a wild resistless storm of tears. Mr Grey, with his spectacles raised on his forehead, looks down on his child curiously. He would begin questioning her at once, but his wife cautions him to silence till the burst of tears abates and the sobs become fewer.

'Katie, what's all this about?'

'Herbert is gone! I shall never see him again!'

'Surely nothing has happened to the Admiral? Be calm, child, and tell me what all this means.'

'He went to London, father.'

'I know. He wrote to me on his arrival there.'

'But he went away in anger; parted from me never to return.'

'Katie, I can't understand you. Compose yourself, and explain.'

Lady Dillworth recognises the voice of authority so potent in the old days, and yields to it by passively producing the Admiral's letter. Her father's brow clouds as he reads it over, and there is stinging contempt in his voice as he exclaims: 'So, my Lady Dillworth, you have been flirting with Walter Reeves again!'

Kate is on her feet in an instant, and confronts him with eyes that flash through her tears.

'I have done nothing of the sort, father; that is all a mistake. What do you take me for? I am Sir Herbert's wife, remember.'

'Then how am I to understand this letter?'

Katie explains. She does not attempt to shield herself, nor hide any single particular; and her father softens when he finds she has been more thoughtless than intentionally culpable. Still he speaks out his mind, and says with a husky voice that trembles with emotion: 'A short time ago I

gave my daughter to a brave good man, whose only fault was over-indulgence; and before the end of one short year, I find she has grieved him with her folly, injured him with her thoughtlessness, and finally driven him from his home.—Now, don't interrupt me, Katie. Have you ever read of the foolish woman that "plucketh down her house with her hands?" *You have done that.*

The room is silent, except for Helen's sobs. Katie stands like one frozen to marble while her father heaps reproaches on her head. She feels she has given cause for them, and raising her hands with passionate eagerness, exclaims: 'Help me, help me, father! Tell me what I can do. I would give my very life to set things right again.'

Mr Grey shakes his head gravely. 'Such things are not so easily mended, Katie. The first step will be for you to return home and wait there till your husband comes.'

But here Mrs Grey interposes. With a mother's keen discernment, she sees Katie is on the very verge of distraction; a more prolonged pressure, and the brain must give way. She pleads for her daughter.

'Let Katie stay here to-night, dear. She needs rest and nursing; and there are none but servants in that great lonely house.'

'And a pretty scandal those same servants will give forth, when they tell all over Seabright to-morrow how their mistress ran away from her home.'

'Go to them, dear. *You* can stop their tongues. I tremble for Katie if she returns there to-night,' whispers Mrs Grey hurriedly in her husband's ear; and her persuasion prevails.

Mr Grey arrives at Government House just in time. He finds the whole place in confusion, every one looking impatiently for the mistress, and wondering where she can have gone so late. Hunter is more alarmed than any of the others, though he tries to assure them there is nothing wrong. He has seen through some of the late household events, and knows that Lady Dillworth, with her pale face and restless eyes, has been on the verge of despair for a long time past. So he feels a sense of relief when Mr Grey comes in, with a voice of authority that scatters suspicion to the winds.

'Lady Dillworth is at my house, and her mother has prevailed on her to stay there to-night. Hunter, you can bring over the mail-bag in the morning; and tell Hannah to pack up a few things for her Ladyship's use, in time for her to dress to-morrow.' So the servants are pacified; and Seabright is cheated of its scandal.

No more reproaches fall on Katie after her father's departure. Though they cannot banish her sorrow, Helen and her mother soothe her despair with the touch of loving hands, the sound of sympathising voices. There is rest and relief in their affection, and Katie grows calm, despite her self-reproach.

By-and-by Mrs Grey leads her up to the little bedroom that was hers before her marriage, and ere long she is nestling among the snowy pillows, weeping and praying for her husband—and herself.

CHAPTER XV.—NEWS AT LAST.

Katie must have slept, for towards morning she dreams she is out on the Short Reefs, and sees the

Daring go down with her husband, father, and all her household on board. They glare at her with accusing eyes, and call her 'Fiend, murderess!' So it is a relief to start up and find it was all a dream. In the dim gray light she sees a figure all in white by her bedside, and is ready to shriek with fright, till she discovers it is only her mother in her white dressing-gown, with a lamb's-wool shawl over her shoulders. Mrs Grey has been watching, in and out of the room nearly all night, and now she bends over and kisses her daughter. I have good news for you, Katie.'

'O mother, what is it? Has Sir Herbert come back?'

'Not yet, dear. The news is, that the poor sailors supposed to have been lost in the *Daring's* gutter are not drowned after all. An outward-bound vessel picked them up and took them on to Havre. They returned here safe and well this morning, so there has not been a single life lost.'

'Thank God for that!' exclaims Katie reverently, with clasped hands; and never was ejaculation more heartfelt.

'Yes, He is very merciful; we must trust Him more, Katie.'

'Mother, I have even doubted His mercy sometimes! In my misery, I thought even *He* had turned against me; but those wretched feelings are past now, and if Herbert would come back, even happiness might return to us again.'

There are many letters in the mail-bag that morning, but Lady Dillworth lays them all aside—only one interests her, and that bears the Hayes Hill post-mark. 'This is from Laura Best; perhaps there is news of Herbert in it.' Katie opens the envelope with trembling hands, glances at the contents, and exclaims: 'Herbert is ill—lying ill at Laura's, and she has written to summon me down there.'

The particulars are soon made known. The Admiral went to Hayes Hill on his return journey from London, and as soon as he arrived there, was stricken down with sudden illness. He had shewn no sign of recovery up to the present, and Laura's letter was most urgent.

'I must go to Herbert at once. Oh, why did he go *there* in his time of sickness and danger? When he felt the attack coming on, why didn't he come back to me?'

'Ah, why indeed?' echoes Mr Grey gravely, as he folds up his papers and locks his desk.

Soon all is bustle and preparation. Mr Grey hurries everybody half out of their wits in his anxiety to be in time for the next train to Hayes Hill. He has decided on going down *there* with Katie, and says he will not leave her till he sees her once more under the same roof with her husband. Lady Dillworth's boxes are sent to the station direct from Government House; and she and her father are soon speeding on their way as rapidly as the swift locomotive can take them. It is a cold misty day, and Katie glances out on the dreary country with a listless eye and a heart as dreary as the scene. She fears that after all she may be too late to see her husband alive; and even if he is living, she wonders whether he will forgive her, or again turn from her with that sorrowful look of reproach.

At last they reach their destination, and are soon driving up the lane to Hayes Hill in Laura's brougham. Though the twilight is fast gathering,

Katie sees the house is a long low one, built of red brick, and in bungalow fashion. Robert Best had it erected in that form as a souvenir of his early days in India. With a show of eastern exterior, it yet contains every possible comfort and luxury our colder climate needs. It is a residence that bears more sign of convenience than style.

The entrance-hall is large, and brightly lighted up, and Katie feels dizzy as her father leads her in from the cold outer air. A silence as of death reigns in the house—even the slim youth who opens the door speaks in a subdued whisper. Perhaps it is all over!

'O Herbert, my darling!' repeats Katie to herself, and her heart gives a wild throb, and then seems to grow still and cold. She cannot frame the question she longs to ask; but Mr Grey inquires at once.

'How is the Admiral now?'

'Much the same, sir. Two doctors are with him at present.'

The page throws open the door of a room on one side of the hall. Laura's sitting-room evidently, for her work is lying on the table, also her desk, on which is a half-written letter. Presently, a light step is heard, and Mrs Best comes running in with outstretched hands. There is no question of jealousy or restraint now. Laura clasps her father's wife in her arms and kisses her tenderly.

'Oh, I am glad you are come! I feared you would be too late.'

'Is he dying? Is my husband—dying?' Katie inquires with a sob.

'He is very ill. But you must be calm, and help me to nurse him. He has been repeating your name so often!'

'Has he really asked for me? Oh, I am so thankful!'

'Perhaps not *asking* exactly, for his mind is unsettled. At one time he mentions your name with the tenderest epithets; at another he talks of you in a strange wild way, very painful to hear.'

'I wonder whether he will know me?'

'We will see when the doctors have finished their consultation.'

Ere long, poor Katie, leaning on Laura's arm, enters Sir Herbert's room, and there she once more sees her husband's face.

What a change one short week has made! There is nothing but a flushed fevered countenance, restless wandering eyes, parched lips, and throbbing brow, for her to gaze on. She might have been the veriest stranger for all the recognition she gets.

Laura whispers softly: 'Don't be startled, dear. He is not conscious now; but when he wakes up to reason again, he will be so glad to have you near him.'

But many days pass before that. It is a case of long nursing, of long nights of watching, and weary hours of doubt and anxiety. Through it all, Mrs Best is so earnest, so tender-hearted, so unselfish, that Lady Dillworth finds herself wondering over and over again how she ever could have disliked her so much in the old days gone by. All her petty airs, her studied affectations have vanished: she looks a pale anxious woman, with traces of watching and weariness in her face. Her dress is studiously plain—a deep gray in colour, and of some soft noiseless material, whose folds do not rustle or creak as she moves about the sick-room.

Her voice is low and gentle, her words wise and hopeful, and the poor heart-broken wife clings to her for help and sympathy—and not in vain. Days pass on. Mr Grey returns home to wind up his affairs, for his secretaryship expires with the Admiral's resignation; but he promises to return to Hayes Hill again, on the shortest notice, if needed. Wife and daughter take turns of watching beside Sir Herbert, sharing each other's anxieties and hopes.

The best hours of Katie's life now are those she spends by the Admiral's side in that still room. She seats herself in the arm-chair, places the lamp so that its rays may fall faintly on her husband's face, and then watches the familiar features, the high forehead, and wonders whether those lips will ever again talk to her of love and speak forgiveness. She would fain fling herself on his breast and press her lips on his, fevered as they are; but she dares not till he himself shall have called her to him again. And so she sits there musing, hoping, praying. Come what will, Lady Dillworth will never again be the vain, selfish, frivolous, thoughtless woman she once was. Laura's society is working her good; there is a softness and sweetness in her manner never before visible.

One bright afternoon in spring, Lady Dillworth has taken up her position by the bedside. She can watch the invalid, and with a turn of her head can glance at Laura and her boys, who are in the grounds outside the window. The scene out there is calm and pleasant. A sloping lawn extends almost down to the river, on which some water-fowl are lazily floating. Beyond the river rises a grove of trees, now fast unfolding their tender green buds and drooping tassels. Laura's boys are bright, golden-haired, blue-eyed little fellows, lively as butterflies, and just as restless. They flit in and out the shrubbery, gathering violets for Lady Dillworth. Presently they bring her a bunch, and she stands at the bedside with them in her hand. But what is this that arrests her? A change has come over her husband's face, so remarkable that she holds her breath with sudden awe. Is it the portent of death?—the settling of the features into the calm repose that proclaims life's warfare over?

The haggard anxious expression has quite vanished; he seems to sleep quietly as a child. A soft glow steals over his cheeks, then his eyes open, and he looks up with that smile she knows so well.

'Katie, my wife! are you here? I have had a frightful dream.'

'The dream is over now, Herbert.'

'Then it is not true that you are weary of me and longing for freedom?'

'No, Herbert. I have not grown weary. Never were you as precious as you are now! Darling! darling! say you forgive me, and love me still.' Her eyes are full of tears, and she sinks down beside him.

'What was it about Walter Reeves? He has been troubling my thoughts and driving me mad,' Sir Herbert repeats musingly.

'Walter Reeves is not in England now; he is gone to Italy with his wife. Liddy Delmere and he were married a fortnight ago.'

'Come nearer, my pet; come nearer me, Katie, my wife! Let me feel your kiss on my lips once more. Oh, I have been nearly heart-broken, nearly dead; but hope is returning. The strong

arm of Mercy has brought me back to life again; and I feel as if there is happiness in store for us still.'

Laura Best comes in ere long, and finds Katie still kneeling beside the bed, her hands clasped in her husband's, and the light of fond affection glowing from her eyes as she looks tenderly into his. The bed is bestrewn with early violets, for Katie has flung down her flowers in her agitation, and the perfume is filling the room like a soft breath from the garden. Laura is not one whit calmer than Katie; she kisses her father, and weeps tears of joy, and feels he is given back to them from the very grasp of death. Marvellous to relate, all this flutter and excitement does not injure Sir Herbert or throw him back. Life has returned to him in too full strength for that. The delight of reunion, the joy of returned confidence in Katie, is like a draught of some invigorating potion to his heart, and from that hour he speedily recovers. All his doubts and distrust are over; all Katie's frivolity and worldliness have fled. They begin a new and more complete life together. True, the rest of the Admiral's days are doomed to be spent in retirement; as years pass by, he sees younger men stepping into the post he should have occupied, and gaining honours he once hoped to win.

True, he misses the full deep draught of power, the very taste of which had been sweet to him. Katie too has lost the brilliant colouring that once lit up her path; but neither of them repines at the change. Though Admiral Sir Herbert Dillworth's flag no longer flutters at the mast-head, and though his wife no longer leads the fashions, they are happy, with a higher, purer happiness than they ever knew in the days they spent at Government House.

THE END.

THE MAFIA AND CAMORRA.

THESE are two Italian words of evil import. They signify confederacies of villains of all ranks in society who live by exacting black-mail on traders. Our occasional observations on the proceedings of these illegal associations, as also on the system of brigandage in Sicily, have been somewhat trying to certain Italian journalists. They do not absolutely deny the existence of these social disorders, but speak of them as insignificant, and are shocked that they should be made a matter of comment among strangers. We are willing to believe that our remarks, like those of others, drawn from authoritative reports, have done some good, and certainly no harm. The comments of the English press may have a salutary effect in curing evils which the native press of Italy fears almost to touch upon. Vast numbers of English travel in Italy—some of them residing for a season on the score of health—and all stand in need of protection from petty extortions and robbery. If the Italian government be unable to give the degree of security which is claimed by peaceable foreigners, it is at least desirable that the English who venture abroad should be made aware of the vexatious exactions and impediments which probably await them. In our last notice on this subject, we stated pretty plainly that the ordinary course of justice in Italy, and more specially in Sicily, was seemingly unable to quell the disorders

here referred to, and that nothing short of prompt military execution would avail. For what signifies the paltry process of capturing and imprisoning a few disturbers of the peace, and then shortly setting them free, to carry on their robberies and murders as usual? If the southern provinces of Italy are to cease to be a disgrace to civilisation, the true remedy must consist in the ready appeal to a court-martial, speedily followed by execution.

As if at length stung by the remonstrances of English newspaper writers, the government of Italy have latterly shewn increased vigour in the attempt to extirpate brigandage in Sicily, with, we are told, good results; and now they are to all appearance resolved on striking a blow at the Camorra in Naples. We are made acquainted with the fact by *The Times*; and should any English journal specially deserve praise for its denunciations of the scandalous manner in which travellers in Italy are liable to be annoyed by the misconduct of officials, it is that paper, which through its correspondents is able to offer instructive accounts regarding the illegal and hitherto almost unchecked Italian associations. Its Naples correspondent, under date September 4, writes as follows; it being only necessary to premise for inexperienced readers, that while *Camorra* is the name of the association, *Camorrista* signifies a member who participates in its gains—plural *Camorristi*:

'The resolute attempt which is at last being made to destroy that organised criminal association known as the Camorra is the all-absorbing interest of the Southerners. Its long existence and its vast number of crimes are matters of history. Thriving under despotic governments, and later still under political complications, it has recently raised its head again, and has brought down upon it all the strength of the police. *Razzia* after *razzia* has been made on the body, and during the last sixteen or seventeen years, hundreds, perhaps thousands, have been seized and sent off to the islands, only to return and renew their operations; but one day this week a blow was struck which reflects great credit on the energy and courage of the Quæstor. The Camorra is a noxious weed which is to be found everywhere and among all classes of society; but it flourishes especially in the markets, where its agents tax every article of food, arrange the prices, and then leave with their pockets full of their ill-gotten profits. On one of these markets, therefore, an attack was made on Thursday morning. The ground had been well examined before, and twenty or thirty guards in plain clothes were sent early to mingle in a crowd of about two thousand persons, and watch the mode of conducting business. First comes in a peasant or *cafoni*, as the *Pungolo*, adopting the common term, calls him. He is laden with the produce of his land—fruit and vegetables—and the Camorrista presents himself and demands his tax of deposit. It is paid without dispute, as it has been for time out of mind. The *cafoni* of course wishes to sell his goods, but is unable to do so until the Camorrista settles the price and takes his part, which is given without dispute. The purchaser, the man who retails his goods in the streets of Naples, on his over-laden donkey, then comes on the scene; but he cannot carry off his goods without paying the Camorrista a

few sons for portorage, he himself at last being compelled to be his own porter. Now this is what happened last Thursday in the market of St Anna della Paludi. It is what occurs in every market, every street, every corner of Naples, and what has happened from time immemorial. St Anna was the spot then fixed on for a determined attack last Thursday. Besides the guards in plain clothes, the market had been surrounded early in the morning by police and carabinieri, while a tolerably strong force of Bersaglieri was in attendance close at hand. On a sudden every gate and way of exit was closed, and the guards came down on the astonished people. Flight or resistance was out of the question; and the end of the matter was that fifty-seven of the most notorious of the order were netted, bound together by a long rope, and surrounded by the public force, carried off to the nearest police station. An immense crowd, consisting of their relatives and associates, had collected; but no attempt at rescue was made, for things had been admirably arranged, and the public force was too strong to allow of any such attempt being made without danger. At the station they were soon committed and sent off to prison in parties of ten; and a glance was sufficient to shew of what different conditions they were composed. There was the Picciotto (the novice of the order), without shoes and in his shirt sleeves; and the full-blown Camorrista dressed as a gentleman, with his fingers covered with rings, and a gold chain round his neck. After a long series of crimes the Picciotto may hope to attain the dignity of this rank, which insures him who holds it ease and comparative wealth. Such a man seldom appears on the scene; he is one of the directors—one of the wire-pullers, and many a wire has he pulled which has cost the life of an opponent. I may instance two cases—that of our unfortunate countryman, Mr Hind, and lately of the man called Borelli; but the annals of blood in this province, if examined, would furnish an incredibly large number of such cases.

The *razzia* in the market of St Anna della Paludi was followed on Saturday by another in the fish-market, with like success. This spot lies on the Marina, *en route* to the railway, and the space between the two places has long been celebrated for the robberies committed on carriages conveying strangers to and from the railway. Here every morning are brought in fish from all parts of the bay, consigned to the contractors, who again supply the retail dealers. A good business, therefore, is to be done by the Camorrista in this place; and no wonder is it that it should be thronged with men of that class and thieves. The same operations are performed which I have already described. The right to land is paid for; then the price of the fish is settled, and a certain percentage demanded and paid. Last of all, as in the fruit and vegetable market, the retail dealer has his accounts to settle. These claims have never been disputed—they are sanctioned by usage; and dangerous would it be to resist a secret organisation of ruffians who stick at nothing to maintain their "rights" and inflict vengeance. On this market an attack was made on Saturday, and fifty-nine of the worst characters were netted, there being, as before, a considerable display of the public force. An attempt was made also to arrest some of these fellows at the entrance of the Bourse,

who drive a trade in defrauding poor widows and orphans and getting possession of the certificates of their pensions. Three only were taken, as others who had got scent of the pursuit made themselves scarce.

'An Italian friend suggests that the only sure mode of doing away with the Camorra would be to sink Naples under the sea for half an hour, which would be about as practicable as the proposition to drive the Turks out of Europe. If it cannot be destroyed, it may, however, be checked by such *razzias* as we have had of late; but they must be repeated continually. Only two days after the scene of Thursday, some Camorristi presented themselves in the fruit-market and made the usual demand, which was resisted, and the fellows were arrested. The wives too of those who were seized by the police made their appearance, alleging that they were commissioned by their husbands to receive their dues. They too were arrested. From this it is evident that so long as one filament remains, the disease will spread, and that it is the constant application of the knife alone which will eradicate it. It is of good augury, however, that something like resistance was shewn to the demands of the "order." As in Sicily, in the case of brigandage, the consciousness of support and protection from the authorities inspired courage; and it is on the union of these two elements that we must depend for the effectual destruction of this enormous evil. But it will not suffice to lay hold only of the smaller fry; there are men, I am assured, who drive about in their carriages, enriched by the Camorra, and many we meet with no ostensible means of existence, decked out, as I have described, with gold chains and rings.'

Splendidly dressed fellows 'with gold chains and rings!' Such are the *élite* of a gang which for generations has dishonestly preyed on every department of trade in Naples—unauthorisedly exacting a percentage on every transaction under threat of the most dreadful penalties. One is glad to hear of the foregoing *razzias* on the confederacy; but from what we know of administrative justice in Italy, as well as of the utter rottenness of society and universal disposition to baffle the operations of the magistracy, the chances are that the captured Camorristi will soon be at large and at their old tricks. The civil law as it stands is incapable of dealing with this species of ingrained villainy. We have hinted at military repression by regular troops as the right course to pursue. W. C.

NEARLY WRECKED.

IN FIVE CHAPTERS.

CHAPTER I.—THE BETROTHAL.

'AND so, Mabel, Wilfred Merton has proposed to you?' The speaker, as he made this remark, laid down the paper which he had been reading, and looked across the room at its other occupant, who was standing in one of the windows chirping to a canary, and addressing it in that peculiar language which is commonly supposed to be gratifying to the feelings of the feathered tribe, however incomprehensible it may be to differently constructed beings.

Mabel hearing herself spoken to, turned round,

and leaving the bird to its own meditations, came to the table, which was laid for breakfast.

'Yes, papa,' she said, beginning to pour out the tea as she spoke; 'and what is more, I have accepted him.'

'Indeed! You didn't think it necessary then, to ask my permission in the matter?'

'Well, you see I'm afraid I rather took that for granted, and so did not think it necessary to ask for it beforehand. And then too you know Wilfred and I have always meant to marry one another some day, and that it really doesn't make any very great difference whether we call ourselves engaged or not.'

'Oh, you have always intended it, have you? May I ask how long "always" has been in this case?'

'Well, do you know, dear papa, I think we first settled it quite definitely when we were five, when Wilfred gave me the ring out of a wire button as an engagement ring,' answered Mabel, smiling brightly.

'That is a long time ago certainly; and I must congratulate you upon the constancy that you have both shewn in the matter. But don't you think that as it has gone on in this way very happily for such a long time, it might go on in the same way still without any more binding arrangement?'

'O no, papa; we want to have it admitted that we are engaged now.'

'But why, my dear? I thought you said a minute ago that it doesn't make any real difference whether you are engaged or not?'

'Of course I meant to other people, not to ourselves.'

'I should have myself thought your remark was a sword that cut both ways,' said Mr Colherne, smiling at his daughter's explanation. 'But I really don't see that it will do you any particular good to be engaged yet,' he went on more gravely; 'it seems to me that it is only tying you down without any positive advantage.'

'I don't care so very much for it myself,' answered Mabel, looking more serious than she had done yet, as she spoke; 'but Wilfred wishes it so much, and I wish it for his sake. You see he hasn't such an indulgent father as you are darling, or such a happy home as I have; and he says it will make him so much happier to feel that I am really his, and admitted to be so.'

'Well, my child, I suppose you will have your own way in this as you have in most things, you spoilt young monkey! But you can hardly expect me to feel very much elated by the idea that I shall have to get on some day without my Queen Mab.'

'O papa, now you are looking forward a long way! Why, we don't dream of being married yet, and shan't for ages.'

'This is by no means the first time that that remark has been made, for the consolation and encouragement of unfortunate fathers, who have nevertheless found themselves left alone before very long.'

'But then you know even when I do marry I don't mean to be separated from you. Of course you will always live with us.'

'And feel myself constantly in the way,' said

Mr Colherne, more gravely than he had yet spoken. 'No, my pet,' he went on almost sadly; 'it is the fate of parents to lose their children just when they have learnt to love them most, and I mustn't expect to escape the common lot.'

Mabel went to him and kissed his forehead. 'Come, papa, don't be sad just now; you will make me feel a nasty selfish creature for ever thinking of marrying Wilfred or anybody else.'

'I'm sure I don't want to do that, my queen,' replied her father cheerfully. 'But to return to our original subject. What is there in this Wilfred Merton that makes him so particularly attractive?'

'What a question to ask me, papa! There's everything about him. In the first place, he's so handsome!'

'Well, do you know I think he's very much like everybody else? It seems to me, to quote your favourite Humpty Dumpty, that he has "two eyes so, nose in the middle, mouth under." I must confess that he does not strike me as very remarkable.'

'O papa! everybody thinks him good-looking; and I believe in reality you do too, only you are so fond of teasing me. And then he is so clever!'

'I don't know that "everybody" will agree with you there, at all events. The public do not seem to think him so very clever!'

'Ah, but they will some day, when they have their eyes open, and have seen more of his paintings. But I didn't mean clever in his profession only; he says such clever things.'

'Which means, I suppose, that he says he is very fond of you; eh, Mab?' said her father, pinching her ear as he spoke. Then seeing that she did not seem inclined to reciprocate his lively manner, he went on: 'Never mind what I say, my darling; I can't help being a little jealous of the fellow that proposes taking you from me some day. But as I suppose you must be taken away by somebody sooner or later, I would rather it were Wilfred than anybody else, for I believe him to be a good fellow at heart, and honestly fond of you. I must say too, that it is decidedly a recommendation in my eyes, that as he has not a penny, he will not be able to take you till "later." But I must be off now, my child; I am dreadfully late as it is; you see you have kept me talking so, that I have not noticed the time. Good-bye, Queen Mab; take care of yourself while I am away. But I daresay you will have somebody to help you to do that,' he added mischievously as he kissed his pet and left the room.

Mr Colherne and his daughter were living in a house towards the West End of London. He had been a widower for some years, and Mabel was his housekeeper and companion. He was justly proud of his child, and thought her and everything she did, perfection; and Mabel returned this love with all she could spare from Wilfred.

Mabel Colherne was by no means a beauty. Her eyes were not of the dark flashing order that thrills everybody at whom they look; nor were they of that soft melting kind that infuses tenderness into the most unimpressible at the first glance; roses and lilies had nothing to fear from her complexion as a rival to their charms. Sculptors could have looked at her nose and mouth without feeling the slightest desire to reproduce them in marble; and her throat would not have been

remarked upon as swan-like. But she was a thoroughly honest, healthy, happy looking English girl; and saying *that*, is equivalent to something very pleasant to look at. She looked particularly bright and happy now as she bustled about the room, performing various little acts of household arrangement; humming snatches of airs as she went about her business, and stopping at intervals to continue the conversation with the canary, which had been interrupted before breakfast. Suddenly she stopped in the middle of her avocations as the knocker sounded, and a look of merry mischief coming over her face, she got close behind the door of the room, so that when it was opened she would be hidden. Knowing well whose knock it was, she could not resist the temptation of teasing Wilfred by concealing herself. This might perhaps be considered a somewhat undignified way of receiving a young gentleman who was coming to the house for the first time in his new capacity of an accepted lover; but in extenuation of Mabel's conduct it must be remarked that she and Wilfred Merton had known one another intimately ever since they were children, and that their engagement made but little difference to them.

She had hardly more than time to ensconce herself behind the door when Wilfred opened it and came a little way into the room. He seemed a good deal surprised to find the room empty, as Mabel's habits were very methodical and regular, and he was generally sure of finding her here at this time; and was just on the point of going away again to look for her elsewhere, when a suppressed laugh fell upon his ear, and looking round at the place whence the sound came, he espied Mabel standing there. Shutting the door quickly, he pounced upon her, and seizing the maiden by the wrists, took a lover's revenge for her conduct in the shape of more kisses than one. She did not resist very vigorously, and suffered herself to be escorted to the sofa with a very tolerable grace.

'Well, Mabel,' Wilfred said, as he sat down by her side, 'have you told your father?'

'Yes, Wilfred,' she answered demurely.

'And what does he say?'

'Oh, he won't hear of our being engaged,' she said, speaking very solemnly.

A look of such blank disappointment and astonishment came over her lover's face, that Mabel burst out laughing. 'Why, you silly boy,' she said gaily, 'to take it in, and look so dreadfully unhappy! You don't suppose that I mean it, do you?'

'Well, you looked very grave as you spoke,' returned Wilfred, seeming half-disconcerted at having believed Mabel's nonsense; 'and I could not be quite sure that you were joking.'

'Solemn old fellow! Have you ever known papa say no to me when I wanted anything? And besides, was my reception of you of a kind to lead you to believe that I was feeling depressed?'

'Perhaps you wouldn't have felt depressed even if Mr Colherne *had* said no,' returned Wilfred in a misanthropical tone of voice.

'I'm not going to answer such nonsense as that seriously,' said Mabel; 'perhaps I shouldn't: most likely not, I think.'

'Then he has consented?'

'Of course he has, Wilfred.'

'My darling,' he said, drawing her closer to him, 'now that I know you are mine, I shall not feel unhappy any more!'

'Why, Wilfred, how gravely you speak, and how solemn you look. You are not a bit like your usual bright self this morning. What is the matter with you?'

'It's too bad of me to be out of sorts this morning, my pet, when I ought to be so happy; but I really can't help it. You must forgive me, Queen Mab.'

'But what is it makes you so, Wilfred, dear? Do tell me. You know you always do tell me your troubles; and I have more right to hear them now than ever. Besides, I can't bear being kept in the dark about things, especially when they concern you.'

'Oh, it's nothing very interesting or very new; only another row with the governor.'

'What about?'

'Nothing but a recapitulation of the old grievances; the same thing over again that we've been quarrelling about for I don't know how long—as to what a fool I've been to become an artist, instead of entering that detestable counting-house.'

'I suppose he did not describe it in that way,' Mabel could not help interrupting.

'I am so sick of it all, that I don't know what to do with myself,' Wilfred went on, without taking any notice of her remark.

'What led to the talk on the subject? Something, I suppose.'

'The fact that another picture has been refused admission. It's quite bad enough never to get any success, without his incessantly throwing it in my teeth. I declare I get so discouraged sometimes, I haven't the heart to work at all; and then that makes another trouble.'

'But you can't expect to meet with much success yet; you haven't had time. Almost everybody who has succeeded in the world has been unsuccessful at first.'

'Of course; I know that. But then it's so much easier to bear the fact that other people were disappointed, than it is to bear disappointment one's self. It is so much pleasanter to remember some great artist who wasn't appreciated at first, than it is to have one's own paintings perpetually refused admission everywhere. I feel so sure too that I have got the ability in me.'

'The greater reason for hoping and steadily persevering. But you know you have such a dreadful disadvantage to fight against in being so nearly self-taught as you are: you haven't started fair.'

'Of course not. I told my father so to-day when he was pitching into me; and it seemed to open up quite a new idea to him. He thought a little, and then said that he did not want to be responsible for my failing in the profession I had persisted in choosing—you see he takes my failing quite for granted,' Wilfred added bitterly—'and that if I intended working, he would send me to Paris for a year and pay for my studying there.'

'Wilfred! And are you going?'

'Really I hardly know. I think it is not knowing how to make up my mind about that, added to the bother of my father's everlasting grumbling, that has made me down so this morning. Of course I should very much like the advantage it would give me; but then comes the pang of parting from you, and particularly just now.'

'Does your father know that our engagement is settled?'

'Yes; I told him so.'

'And what does he think of it?'

'He says that it is ridiculous nonsense for me to be engaged to anybody; though of course he prefers you to any one else, as he likes you better than anybody. But darling,' he burst out passionately, 'don't mind what he or any one else thinks or says on the subject: my only chance of getting on and doing anything worth doing, is the certainty that I can think of you as mine!'

'You know, Wilfred, that my heart always has been yours, and that it always will be, whatever happens. But I wish Mr Merton had not suggested this Paris scheme; I don't like the idea of it.'

'You have only to command me to stay at home, Queen Mab, and I will throw every other consideration to the winds.'

'No; I don't wish that. Act as you would if you did not know me at all; I could not bear to feel that I had put any obstacle in the way of your success.'

Their talk during the rest of the time they were together was grave and sedate, quite unlike the usual conversation of two young lovers.

When Wilfred had gone, Mabel was more sad than she cared to admit; the interview seemed to have altered matters very materially.

CHAPTER II.—THE PARTING.

It was settled that Wilfred should go to Paris.

Mr Merton was a banker in a good position in London, and he had naturally wished Wilfred, who was his only child, to enter into his office and succeed him in his business. But unfortunately for his schemes, the boy had at an early age developed a strong taste for drawing, and this taste, which had been discouraged rather than fostered, had grown with his growth, until his father had been obliged to admit to himself that it was useless to try to coerce him, and that the lad must be allowed to take his own way. Giving in to an unavoidable necessity, and giving in to it gracefully, are, however, two very different things, and Mr Merton chose the former course. He allowed his son to become an artist, because he saw very clearly that he could do nothing else, but beyond that he did scarcely anything for him; with but scanty instruction, he was, as Mabel had said, very nearly self-taught.

Had Mrs Merton lived to see her boy grow up, things would have been no doubt on a very different footing between father and son; her influence would have been used to soften the disagreement between them; and a woman's influence is rarely ineffectual. But unhappily for them both, she had died when Wilfred was about ten years old; and he and his father were left to rub the angles of their natures against one another, without any one to round the angularity off.

And so it came to pass that when Mr Merton offered to send Wilfred to Paris, although there were many reasons for which the young man would have preferred remaining at home, he thought it would not do to refuse his father's offer, and so accepted it, and prepared for leaving home.

From the moment that this idea had been first communicated to Mabel, she had had a great and

unaccountably strong dislike to it; and now when it was resolved upon, and the time of Wilfred's going was drawing near, an excitable restless feeling came over her, that made her depressed and miserable. This depression so haunted her, that she could not help looking upon it as an omen and a warning.

She tried hard to repress this boding feeling, but in vain; and tried also, and with more success, to keep it from Wilfred's sight; but at last when the day of his departure had arrived, and he had come to say good-bye to her, she could restrain herself no longer, and to his surprise and dismay beseeched him to change his mind and remain at home!

'Why, Mabel, my darling,' he answered, clasping his hands round her waist as he spoke, and looking down fondly at her, 'what do you mean? You have never said a word against my going until now.'

'No; I have been trying not to think of it. But O Wilfred! I have such a strong feeling in my heart that some harm will come of your going; I have had it ever since you first spoke of it. Do stay.'

'You can't be well, my pet; it isn't like you to have such fancies.'

'I know it isn't; but I am quite well; and it is because I am not generally fanciful or nervous that I am so much impressed by the feeling I have now. Do listen to me.'

'My dearest,' said her lover, kissing the upturned face, 'it is too late to change my plans now. Shake off this fancy, my queen, for it is only a fancy. I like going so little myself, Mabel, that you mustn't make it more difficult to me.'

Mabel resolutely withheld herself from saying any more on the subject; but the feeling of dread that she could not explain was strong upon her still, and it was very hard to keep it to herself. When Wilfred left her she clung to him as though the parting were to be for ever; and when she found herself alone, the anticipation of evils to come came back with redoubled force.

CHANGE-RINGING.

THE frequent allusions to bells by our poets are directly conclusive to the strong attachment which binds these sounds to English ears. We all delight in listening to the merry peal, and yet notwithstanding our fondness for the same, and although all our days of rejoicing are considered incomplete without the ringing of bells, it is strange how very little is understood either of the art or science of what is termed change-ringing.

Ringling bells in changes is peculiar to England. When rung thus, the bells are necessarily rung 'up;' that is, each bell, by an arrangement of wheel and rope, is gradually swung until, after describing larger and larger arcs, it swings through a complete circle at each sound or stroke of the clapper. The swinging motion also materially increases the sweetness of the tone. When bells are rung in changes, each bell is brought to a balance after each revolution; and when the bell 'runs' well, very little actual strength is required, and the work, unless pro-

longed, is not so exhaustive as many suppose. In this as in many other things, it is more 'knack' than strength that is required. The tenor bell of the ring of twelve at St Saviour's, Southwark, weighs fifty-two hundredweight; and the wheel, in the grooves of which the rope for ringing it runs, is about nine feet in diameter; yet this ponderous bell with its huge gearing has often been rung by one man for four hours without rest, involving more than five thousand changes; and was once rung for six and a half hours by one man. This, however, was a great feat.

A number of bells hung together is called a 'ring,' the number generally varying from five to a dozen, which last is the greatest number that has yet been hung in a steeple. When the highest note—the treble bell—is sounded first, and followed by the consecutive notes until the deepest or 'tenor' bell is struck, the bells are said to be rung in 'rounds.' And it is worthy of remark that this is the order in which they are rung before 'going off' into changes, and again on 'coming round.'

Those uninitiated in the mysteries of bell-ringing will be surprised to learn that on six bells no fewer than 720 changes can be obtained; that is, the six numbers can be arranged in 720 distinct combinations. The addition of another bell increases the combination to 5040; while on eight bells the enormous number of 40,320 changes may be obtained. As about twenty-eight changes are rung per minute, it takes about three hours to accomplish the whole of the changes on seven bells; and thus to ring five thousand changes is considered a feat, and called a 'peal;' any less number being merely a 'touch.' When changes are rung on seven, nine, or eleven bells, all the eight, ten, or twelve bells are rung, the tenor bell—the key-note—always striking last; this practice is more musical than when the whole number of the bells are working in the changes. Change-ringing upon each number of bells has a distinctive name; thus changes on five bells are called doubles; on six, minor; seven, triples; eight, major; nine, caters; ten, royal; eleven, cinques; and twelve, maximus.

Changes are produced according to certain laws or 'methods;' and by a previously acquired knowledge of the method, each performer, by watching the rise and fall of the ropes, is able to work his bell in the same path in which it would be found to move if the changes were written down on paper. There are several different methods which are practised—namely, Plain Bob, Grandsire, Oxford or Kent Treble Bob, Stedman's Principle, Cambridge, London and Superlative Surprise, and Double Norwich Court. These can all be applied to the different numbers of bells. Thus a touch of Kent Treble Bob Major is that method rung on eight bells.

Although very few persons could possibly be debarred from practising change-ringing by want of physical strength, a good deal of perseverance is necessary to become a proficient in the art. After acquiring the sleight of hand necessary to ring a bell in rounds, a fair amount of practice is also necessary to obtain the quickness of eye—called 'rope-sight'—to work among the other

ropes, in changes. While his hands and eyes are thus busily employed, the ringer must also listen to ascertain whether the swing of the bell is so regulated that it strikes at a proper interval after the one immediately preceding it. In ringing on eight bells, the eight sounds are produced in about two seconds; a quarter of a second therefore elapses between the sounds of the consecutive bells; and as a variation of a quarter of this time is appreciable to a practised ringer, the error of the sixteenth part of a second would lead to jarring results. The hands, eyes, and ears must therefore be in constant unison during change-ringing; and as at the same time the mind must never be relaxed from the consideration of the 'method by which the changes are produced,' the mental and physical powers are kept in pretty active employment.

The fascination which this art has for its followers is shown by the fact that all the great performances in ringing have been undertaken solely for the honour accorded to such feats. When a peal of five thousand changes is attempted, it is considered of no account unless it is 'true.' The requirements are somewhat exacting. If the same change should occur twice, through an error of the composer, it is a 'false' peal. The ringing must be completed without a stop or hitch; and as at any time during the three hours that will probably be occupied, a ringer may lose his way, and cause the others to be confused, a 'jumble out' will probably ensue; the conductor may miss a 'call,' which is required to carry the changes to the length required, or may make one too many; a man may miss his rope and send his bell over the balance; or a rope may break. Thus until the last change of a peal is struck, it is never safe for the ringers to congratulate themselves upon its performance.

Nowadays long peals are only considered as feats when the same men—only one man to each bell—ring throughout the peal. When a peal of great length is attempted there is, therefore, cause to fear that at the last moment one of the men at the 'heavy end,' as the bells near the tenor are called, may knock up. For instance, in ringing according to Stedman's principle—a very complicated method, on eleven bells—the peal of 7392 changes rung in 1848 in four hours and fifty-five minutes at St Martin's, Birmingham, where the tenor bell weighs thirty-five hundredweight, continued the 'longest on record' until 1851, when it was beaten by the College Youths, a very old-established London society of ringers, who rang 7524 changes in five hours and twenty-four minutes at St Giles', Cripplegate, where the tenor weighs thirty-six hundredweight. The Cumberland Youths, another old London society, thereupon tried to beat this performance by ringing 8184 changes at St Michael's, Cornhill, the tenor of which ring weighs forty-one hundredweight. On the first occasion they 'jumbled out' after ringing nearly six thousand changes; and at a subsequent attempt rang six hours and two minutes, but were then so knocked up that they could not finish the peal, and were compelled to stop when they had rung 7746 changes. Now, although this was longer than the peal rung by the College Youths, it was an incomplete performance, not being continued until the bells returned to the order of rounds, which they would have done at the 8184th

change. The Cripplegate peal was at last beaten by a peal of 8448 changes, rung in 1858, at Painswick in Gloucestershire. Although the tenor of the ring of twelve at Painswick only weighs twenty-eight hundredweight, the College Youths actually attempted to beat this length at St Saviour's, Southwark, where the tenor weighs fifty-two hundredweight. They were, however, unsuccessful, as after ringing over eight thousand changes in six hours and a half, they got into a 'jumble,' and thus a most remarkable feat was lost, and considered of no account, when another half-hour would have completed a performance which might never have been excelled. In their next attempt the College Youths were more fortunate, as on April 27, 1861, they rang at St Michael's, Cornhill, in six hours and forty-one minutes, a peal of 8580 changes of Stedman's Cinques, which still remains the longest length rung in this method on eleven bells.

The College and Cumberland Youths have long been worthy rivals in the different mysteries of change-ringing. While the former society dates its origin back to 1637, the latter claims its descent from an old society called the 'London Scholars,' whose origin, however, is lost in antiquity. The earliest known peal by the London Scholars is one of 5040 changes, rung in 1717, on the ten bells which were then in the tower of St Bride's, Fleet Street. This is said to have been the first five thousand ever rung on ten bells.

The rivalry between the societies of College and Cumberland Youths was at its greatest height in 1777. On January 20th, in that year, the Cumberlands rang 6240 changes on the bells of St Leonard's, Shoreditch. This was the longest which had been rung on ten bells by ten men only, and occupied four hours and thirty-four minutes. The tenor bell at St Leonard's weighs thirty-one hundredweight; and as in ringing these 6240 changes, the ringer would never be in a state of rest, as during nearly five hours he would cause a revolving plaything of over a ton and a half to make 6240 revolutions, it might be supposed that no set of men could easily be found who would be desirous of gaining the empty honour of merely exceeding such a performance by so many more hours or minutes. This, however, was not the opinion of the College Youths, who, on February 18th, in the same year, on the same bells, completed a peal of 10,000 changes in seven hours and twenty-eight minutes. After this the Cumberlands evidently took a little preliminary training on the bells of Shoreditch, as on March 12th they rang 5080 changes; on April 5th, 8120 changes; and then on May 10th capped the College Youths' performance by a peal of 10,200 changes in seven hours and forty minutes. The non-university College men were, however, equal to the occasion, and nine days afterwards rang 11,080 changes at the same place in eight hours and two minutes; a performance so extraordinary, that the Cumberland Youths were fain to let it stand as the longest on record until 1784, when, on March 27th, they actually accomplished, at Shoreditch, 12,000 changes in nine hours and five minutes; which peal until this day remains the longest ever rung on ten bells, when all the bells are rung in the changes.

It might be thought that such prolonged physical and mental exertion would have a bad

effect upon the performers; but, whether it is from the fact that only men of the strongest constitutions take a fancy for such exertion, or that the splendid exercise of ringing is, even when carried to such great excess, really productive of benefit, it yet remains a fact that ringers are noted for the great ages to which some of them live to take part in their favourite exercise. As an instance of longevity, the case of Thomas Barham is especially noteworthy. This man, who was a gardener at Leeds, in Kent, was passionately fond of ringing, and during his lifetime rang in considerably over one hundred peals, each of five thousand changes and upwards. He was born in 1725, and died in 1818, aged ninety-three years. At that time, in ringing long peals it was not regarded as a strict rule that there should be no relief to the performers, or that, as now, each bell should be rung throughout the peal by the same man; consequently there does not seem to have been any ordinary limit to the aspirations of the ringers of those days.

About 1750, Barham and his companions were endeavouring to achieve the extent of the changes on eight bells (40,320 changes), any man who was fatigued being relieved by some other ringer. In one of these attempts, on Monday, March 31, 1755, they commenced ringing at two o'clock in the afternoon, and rang until six o'clock on the Tuesday morning, when the sixth bell-clapper broke, after they had rung 24,800 changes. In this attempt, Barham rang the seventh bell for fourteen hours and forty-four minutes before he required to be relieved. On March 23, 1761, they again attempted it, but had the misfortune to overturn a bell after ringing seventeen thousand changes; but on April 7th and 8th in the same year, they are said to have accomplished the 40,320 changes in twenty-seven hours, the eight bells being manned at different times by fourteen men.

The most remarkable of the records which Barham left behind him were perhaps the 'Veteran' peals in which he took part. When fifty-five years of age, he rang in a peal of 5040 changes of Bob Major, occupying three hours and thirteen minutes, when the average age of the eight performers was sixty-one years. In another peal which occupied three hours and twelve minutes, the ages of the performers were 82, 70, 77, 65, 70, 65, 67, and 86; making an average of nearly seventy-three years. Barham also rang in peals occupying over three hours, when eighty-four and eighty-eight years of age. In Barham's case, it is thus fully shewn that the extraordinary performances he took part in did not in any way tend to disable him in his old age. Southey, in his *Doctor*, mentions a peal of Bob Major rung at Aston Church, near Birmingham, in the year 1796—but really in 1789—when eight men, some of whom he mentions were under twenty years of age, rang 14,224 changes in eight hours and forty-five minutes. This, Southey remarks, 'was the longest peal ever rung in that part of the country or anywhere else.' Certainly it was a very clever performance, considering that the tenor of the ring weighs twenty-one hundredweight; but it was really surpassed by a rival band of ringers, who rang at the same church on October 1, 1793, a peal of 15,360 changes of Bob Major in nine hours and thirty-one minutes.

This continued the greatest number of changes rung single-handed until 1868, when the College Youths rang 15,840 changes in nine hours and twelve minutes at St Matthew's, Bethnal Green. The tenor, however, at Bethnal Green is very much lighter than that of the Aston peal, and the latter still remains the longest length rung with such a heavy tenor, and in point of time exceeds the Bethnal Green performance by nineteen minutes.

So little is known about bell-ringing, that erroneous illustrations are prepared by even the best of our illustrated papers, at Christmas-time, and not a little faulty information regarding the *modus operandi* is added. Very few persons seem to be aware that many matters of practical and scientific interest are to be found in the almost unknown art of change-ringing.

CHRISTMAS IN THE ARCTIC REGIONS.

CHRISTMAS is essentially a family festival: our very earliest recollections of it are of a day spent by the whole family together; a day on which the social distinctions of nursery, school-room, and drawing-room were as far as possible abolished, and on which all the little ones who could behave with anything like discretion were taken to church and dined with the elders. As the children grew up and dispersed to school and college, Christmas was still the day on which all reassembled to make one family once more.

But at length there comes a time when this re-assembling is no longer possible, when the girls belong to new homes and new circles, and the boys are scattered abroad in distant lands, whence only loving thoughts can reach the 'old folks at home.' Then the good old Christmas toast, 'To all absent friends,' becomes full of meaning to the few who still assemble round the dear parental hearth, and is followed by a quiet pause, while imagination travels to all quarters of the globe, and the Christmas greeting infolds the whole world in its embrace. And the good wishes as they emanate from the home are met by returning thoughts from the sons, the brothers, it may be the husbands, in the distant lands where they too are keeping Christmas, though among circumstances very different to ours, and still striving as much as possible to keep up the customs they loved when they were young.

To us dwellers in Northern Europe, Christmas, with its apparently unseasonable heat, strikes us by its strange incongruity; but how strange must be a Christmas in the far north, where no sun rises to gladden the day on which the Sun of Righteousness rose upon the earth.

A year ago we had the happiness of welcoming back to their homes the latest heroes of the Polar Seas. We do not need to be reminded how, in May 1875, the *Alert* and the *Discovery* sailed from our shores, having for their destination the Pole itself. The Pole was not reached; that was beyond human power; but we felt that all that men could do was done, and we were thankful to see them home again. It is surely enough to have spent one Christmas in such desolation; in a higher latitude than ever man has reached before, and beyond the farthest point to which

even the Esquimaux, the hardy natives of the lands of perpetual snow, have penetrated in their most distant wanderings; beyond the boundary of all animal life on land or sea, there British sailors and British ships have wintered, and the British flag has floated upon a sea of eternal ice. All honour be to them.

It seems to us wonderful that even with every attainable comfort, men should be able to live through an arctic winter, as any disaster to the ships must be certain death to the crews. That this has been the case before now, we know. That it is not invariably the case we know also; and the following account gives us a good picture of the different ways in which two companion vessels spent their Christmas in the frozen sea in 1870, and shews what diverse vicissitudes may be encountered by ships in the same season.

In the spring of 1870, before the war with France had broken out and taken up almost all the thoughts of the nation, Germany sent out two ships, the *Germania* and the *Hansa*, with the hope of reaching the North Pole. As is usually the case in arctic expeditions, little could be done during the first season, and the ships were obliged to take up their winter-quarters off the east coast of Greenland. They had already been separated, so that the crew of one vessel had no idea of the condition of the other. An officer upon the *Germania* thus writes of their Christmas:

'To the men who have already lived many weary months among the icebergs, Christmas signifies, in addition to its other associations, that the half of their long night—with its fearful storms, its enforced cessation of all energy, its discomfort and sadness—has passed, and that the sun will soon again shed his life- and warmth-giving beams on the long-deserted North. From this time the grim twilight, during which noon has been hardly distinguishable from the other hours, grows daily lighter, until at length all hearts are gladdened, and a cheerful activity is once again called forth by the first glimpse of the sun. Christmas, the midnight of the arctic explorer, thus marks a period in his life which he has good cause to consider a joyful one. On no day would it be more natural for him to recall his home; and though far from that loved spot, and cut off from all intercourse save with his little band of comrades, and being, moreover, uncertain whether the ice will retain him in its grasp, as it has retained so many before him, he is right to keep the festival with all cheerfulness; thankful, while remembering what he has already passed through and achieved, and full of firm courage and confidence for the unknown future.

'What are our friends at home doing? was the thought that stirred us all as we prepared to keep our Christmas 1870, in the true German style. We had no suspicion of the mighty struggle in which our Fatherland was then engaged, for what could we know of the affairs of the world, from which no sound had reached us for so many long weeks. Our world was only in our ship, and all around us, in the half-light of the weary monotonous arctic night, lay the apparently boundless desert of ice, while the snow-laden hurricane howled and moaned through the silence. We thought too of our mates on our companion-ship the *Hansa*, from whom we had been separated. Did they still live? Had they been so fortunate

as to reach the shore, and were they, like us, honouring Christmas? Who could tell?

'For days before the festival, an unusual activity was observable all over the ship; and as soon as the severe storm which raged from December 16th to the 21st had abated, parties were organised, under our botanist Dr Pansch, to certain points of Sabine Island, near to which we were anchored, where, in a strangely sheltered nook, several varieties of a native Greenland evergreen plant, *Andromeda tetragona*, were to be found. A great quantity of this plant was conveyed on board, to be converted into a Christmas tree. Under the orders of Dr Pansch, the *Andromeda* was wound round small pieces of wood, several of which were attached, like fir-twigs, to a large bough; and when these boughs were fastened to a pole, they formed a very respectable fir-tree.

'After dinner on Christmas-day, the cabin was cleared for the completion of the preparations; and on our recall at six o'clock, we found that all had assumed an unwontedly festive appearance. The walls were decorated with the signal-flags and our national eagle; and the large cabin table, somewhat enlarged to make room to seat seventeen men, was covered with a clean white cloth, which had been reserved for the occasion. On the table stood the "fir" tree, shining in the splendour of many little wax-lights, and ornamented with all sorts of little treasures, some of which, such as the gilded walnuts, had already seen a Christmas in Germany; below the tree was a small present for each of us, provided long beforehand, in readiness for the day, by loving friends and relatives at home. There was a packet too for each of the crew, containing some little joking gift, prepared by the mirth-loving Dr Pansch, and a useful present also; while the officers were each and all remembered.

'When the lights burned down, and the resinous *Andromeda* was beginning to take fire, the tree was put aside, and a feast began, at which full justice was done to the costly Sicilian wine with which a friend had generously supplied us before we left home. We had a dish of roast seal! Some cakes were made by the cook, and the steward produced his best stores. For the evening, the division between the fore and aft cabins was removed, and there was free intercourse between officers and men; many a toast was drunk to the memory of friends at home, and at midnight a polar ball was improvised by a dance on the ice. The boatswain, the best musician of the party, seated himself with his hand-organ between the antlers of a reindeer which lay near the ship, and the men danced two and two on their novel flooring of hard ice!

'Such was our experience of a Christmas in the north polar circle; but the uncertainties of arctic voyaging are great, and the two ships of our expedition made trial of the widely different fates which await the traveller in those frozen regions; and while we on the *Germania* were singularly fortunate in escaping accidents and in keeping our crew, in spite of some hardships, in sound health and good spirits, the *Hansa* was crushed by the ice, and her crew, after facing unheard-of dangers, and passing two hundred days on a block of ice, were barely rescued to return home.'

Yet even to the crew of the ill-fated *Hansa* Christmas brought some share of festivities. The tremendous gale which had raged for many days

ceased just before the Day, and the heavy fall of snow with which it terminated, and which had almost buried the black huts that the shipwrecked men had constructed for themselves upon the drifting icebergs from the debris of the wreck, had produced a considerable rise in the temperature, and there was every indication that a season of calm might now be anticipated.

The log-book of the *Hansa* thus describes the celebration of the festival: 'The tree was erected in the afternoon, while the greater part of the crew took a walk; and the lonely hut shone with wonderful brightness amid the snow. Christmas upon a Greenland iceberg! The tree was artistically put together of fir-wood and mat-weed, and Dr Laube had saved a twist of wax-taper for the illumination. Chains of coloured paper and newly baked cakes were not wanting, and the men had made a knapsack and a revolver case as a present for the captain. We opened the leaden chests of presents from Professor Hochstetter and the Geological Society, and were much amused by their contents. Each man had a glass of port wine; and we then turned over the old newspapers which we found in the chests, and drew lots for the presents, which consisted of small musical instruments, such as fifes, jews-harps, trumpets, &c., with draughts and other games, puppets, crackers, &c. In the evening we feasted on chocolate and gingerbread.'

'We observed the day very quietly,' writes Dr Laube in his diary. 'If this Christmas be the last we are to see, it was at least a cheerful one; but should a happy return home be decreed for us, the next will, we trust, be far brighter. May God so grant!'

THE MISTLETOE.

THE following notes regarding the mistletoe, which we extract from Hardwicke's *Science-Gossip*, may be interesting to our readers. The writer informs us that 'the mistletoe abounds far too much in the apple orchards of Worcestershire and Herefordshire, but passes over pear-trees, and long observation has only given me two or three instances where pear-trees had mistletoe upon them. The apple was known to the Druids, and it has been suggested that the wily priests furtively transplanted their mystic plant from apple-trees, where it was sure to grow, to oaks, where otherwise it would be unlikely to be found. This is rendered not improbable by what Davies says in his *Celtic Researches*, that the apple-tree was considered by the Druids the next sacred tree to the oak, and that orchards of it were planted by them in the vicinity of their groves of oak. This was certainly an astute plan for keeping up the growth of the mistletoe.

'Blackbirds, thrushes, and fieldfares are fond of the mistletoe-berries, and when their bills get sticky from eating them, they wipe their mandibles on the branches of trees where they rest, and from the seeds there left enveloped in slime, young plants take their rise. I have thus observed mistletoe bushes extending in long lines across country where tall hawthorns rise from hedges bounding the pastures; for, next to apple-trees, mistletoe is most plentiful upon the hawthorn. But rather curiously, in modern times, the parasite has shewn a predilection for the black Italian poplar, which has been much planted of late years; and wherever in the Midland counties this poplar has been

planted, the mistletoe is sure to appear upon the trees in a short time. The lime is also very often obliged to support the plant, which disfigures its symmetry, raising huge knots upon its branches; and I have observed limes that must have nourished protuberant bushes for thirty years or more. The maple, the ash, and the willow have frequently mistletoe bushes upon them; but common as the elm is, that tree almost entirely escapes an intrusion; and indeed I never but once saw mistletoe upon an elm. On the oak it is very uncommon in the present day, and where apparent, it is on trees of no very great age, whatever their descent may be.

'My friend Professor Buckman, who has written economically upon orchards in his useful book on *Farm Cultivation*, asserts that while the mistletoe is hurtful to the tree in hastening its decay, yet in apple-trees it has the effect of pressing on their maturity and fruit-bearing earlier than would be the case without the parasite, which urges a quicker growth upon its foster-parent. The tenant of an orchard would thus be benefited for a few years, though premature decay would be the result.

'Authors may differ as to the etymology of mistletoe, but it appears to me that our common English name has no very recondite origin. *Mistion* is an obsolete old English word, used, however, as late as in the writings of Boyle; and this is defined in Dr Johnson's original folio edition of his Dictionary as the state of being mingled. Now this is truly the condition of our plant, which is intermingled with the foliage of other trees, and mixes up their juices with its own; and is indeed in rural places still simply called the *mistle*. If to this we add the old English *tod* or *toe*, signifying *bush*, we have at once the derivation, meaning the *mingled bush*, mixed up and growing among foliage dissimilar to its own. Still, in winter its stiff and leathery evergreen leaves and dense bushy aspect give it a visible position on its own account; and thus the epithet of *frigore viscum* given it by Virgil is peculiarly applicable. It is certainly remarkable that the hanging up of mistletoe in houses for mirthful purposes and emblematical of Christmas should so long endure that the Midland towns have their markets filled with it as Christmas approaches, and loads of it find a ready sale in the north of England (and Scotland), where the plant is a rarity, if found at all.'

A LOCAL INSTANCE OF CANINE ATTACHMENT.

A correspondent of the *Rotherham Advertiser* writes: 'Stories almost innumerable have been enumerated illustrative of the sagacity of the dog and its attachment to its owner. A remarkable and well-authenticated instance, which may not be uninteresting, has just come under my notice, as having occurred some years ago in the neighbourhood of Rotherham. A person in Rotherham obtained a young shepherd dog, which he retained for a long period. While in his possession it became much attached to the whole of the family, and especially to two of its master's sons. After a time, circumstances transpired which led to the animal being sent to live permanently at the residence of a farmer at Thorpe Salvin. After the lapse of a considerable time, one of the sons of the dog's former master paid a visit to the farm. The dog on seeing him appeared

to be overjoyed, and was most demonstrative in its indications of delight. During his stay it would not leave him; and when it became necessary for him to leave in the evening, the animal could scarcely be restrained, and had to be chained up in the room where the family were sitting. As the visitor was taking leave of his host, the poor animal howled in a most piteous manner, and manifested other unmistakable signs of grief. Immediately he had left the house, the dog all at once became quiet, and settling down on the floor, seemed to be asleep. The strange and sudden change which had come over the animal was remarked, and on the parties going to him, he was found to be quite dead. The singular occurrence became well known in the neighbourhood, and it was regarded that the dog had died literally heart-broken. When the same dog was only a puppy it was attacked and beaten by a bigger dog. The defeated animal shewed his sagacity and at the same time his revengeful feelings, by waiting until eighteen months had elapsed, when it had fully grown, and then he lay in wait for his old adversary as near as possible to where the former combat took place, and gave his former enemy a "drubbing" that nearly cost him his life.'

MONUMENT AND TURF.

Full in the midst of these gray bounds
A lordly stone upswells;
The scroll, that thrice its bulk surrounds,
The passing stranger tells
Of what renowned line he came,
Who 'neath the marble lies,
What deeds he wrought of mark and fame,
That live when mortal dies.

And deep is graved how high his worth
Was prized, how widely known,
What honours crowned him from his birth,
What grief had raised the stone:
Yet he sleeps calmly on beneath,
Where Silence mocks at Fame;
Nor heeds the pomp made over death,
This blazon of his name.

Some paces off and thou wilt see
A grave of simple show,
As lowly and retired as he
Had been who rests below;
High rank and riches kept afar,
While they enjoyed their day,
The high and low—what social bar
May now divide their clay?

No honours mark the poor man's tomb,
This green secluded spot,
Yet still the pansy's purple bloom
Proclaims him not forgot;
No graven stone reclines above
To mourn the humble dead,
But woman's grief and children's love
Bedew the hallowed bed.

Nor here is any record hung
Of lineage and race,
The turf alone tells whence he sprung
Who fills this narrow space;
His virtues slumber with his dust,
Unrecked of and unknown;
But God in Whom reposed his trust
Receives him for His own.

WAR AND TELEGRAPHY.

It is vexing, even saddening, to think how large an amount of discovery, invention, and skill is applied to the murderous purposes of war. As we advance in civilisation, armies become larger and larger, and more abundantly supplied with agencies we would willingly see devoted to more peaceful purposes. Whether wars of race, wars of creed, wars of ambition, or wars of national vanity, the result is much about the same in this respect. Some consolers tell us that wars by-and-by will become so terrible as to check the desire to wage them: let us hope so, despite present symptoms.

Science has unquestionably rendered a vast amount of aid to attack and defence in war within the last few years. Gunpowder, gun-cotton, dynamite, and other explosive substances for fire-arms, torpedoes, and military mining have had their properties and relative powers investigated with remarkable completeness. Gun-carriages have been so vastly improved, that by Captain Scott's contrivances a six-hundred-pounder can be managed as easily and quickly as a thirty-two-pounder could in the days of our fathers or grandfathers; while by Major Moncrieff's automatic apparatus a gun lowers itself behind the screen of a parapet or earthen battery for loading, and then raises itself twelve or fifteen feet to fire over it.

Photography, again, is applied in a great variety of ways to aid warlike operations. At the office of the Ordnance Survey, or under the supervision of the Director, an amazing number of such photographs are taken, enlarged or reduced from the original dimensions according to circumstances, and multiplied or prepared for printing by a very rapid process of zincography or some other kind of electro-engraving. One of the Reports issued by the Director tells us that he supplies the War Office with photographs of plans of battles, important fortified posts and their surrounding districts, barracks and forts in all parts of the British dominions, &c. All the equipments of troops for the field are similarly photographed or zincographed, as unerring patterns for reference. For such wars

as we have been engaged in during the past five-and-twenty years (happily few in number), such as the Crimean, Abyssinian, and Ashanti campaigns, photographs and zincographs have been supplied in large number to the officers, illustrating all details which the home authorities have been able to ascertain, and which are likely to be useful in the intended operations.

What are we to say of the *torpedo*, and its management by electricity? This is really a wonderful subject, the influence of which on future naval warfare even the most skilled and experienced officers can only dimly surmise. We know that during the civil war in America, the Federal torpedoes wrought more destruction on the Confederate ships than all the guns in the Federal fleet; that, on the other hand, the Confederate torpedoes so effectually guarded the approach to Richmond up James River, that a hostile flotilla was compelled to retire baffled and disappointed. One unlucky Federal ship unwittingly passed over a submerged torpedo at the moment of explosion. And with what result? 'The hull of the ship was visibly lifted out of the water, the boiler exploded, the smoke-funnels were carried away, and the crew projected into the air with extreme velocity. Out of the crew of one hundred and twenty-seven men, only three remained alive—the vessel itself being blown to atoms.' The arrangements have been so much improved since that time, that messages can be sent across a river or estuary from shore to shore through the very wire which is to discharge the torpedo! In every naval war during the last few years, torpedoes have been more or less employed. In what way the weaker Russian fleet has been able to baffle the stronger fleet of the Turks in the struggle of 1877, the newspapers have told us in full detail. There is no necessity for pursuing this part of the subject further, seeing that it was lately treated with some degree of fullness in our pages.

But the greatest marvel of all, in regard to the application of electricity to warlike purposes, is the *electric telegraph*. We know what service the lightning-messenger renders to society generally

in the peaceful daily maintenance of commercial and social intercommunication ; and military men now know what a potent instrument it is in the conduct of field-operations and siege-works. An officer well qualified to judge affirms that the memorable Franco-German War, so disastrous to France, could not have been carried on without the aid of the electric telegraph by the German forces. The warlike struggles engaged in by various European powers in the Crimea, in India during the Mutiny, in China, in New Zealand, in the Austro-Italian provinces, in Morocco by the Spaniards, in America by the Federals and the Confederates, in Holstein during the brief Dano-German War, in Bohemia during the still briefer Austro-Prussian War, in Abyssinia, in France during the struggle against the Germans, in Ashanti—all these were marked by the adoption of the electric telegraph to a greater or less extent.

Many of us remember, from the vivid descriptions written by the special correspondents of the daily newspapers, how terrible were the sufferings of the British troops in the Crimea during the winter of 1854-5, engaged in trench-work and other siege-operations under almost every kind of privation. But we also know how impossible it would have been to learn the news quickly in England and to send instructions, without the aid of telegraphy. An electric cable was for this very purpose submerged in the Black Sea from the Turkish mainland to the Crimea ; while on land, wires were set up from Balaklava to the headquarters outside Sebastopol. Thus it was that daily messages could be exchanged between Lord Raglan's headquarters and the War Office in London—also between the special correspondents of the daily papers and their employers in Fleet Street or Printing House Square. So in like manner, during the struggle arising out of the Indian Mutiny, the advancing British columns contrived, wherever possible, to maintain unbroken telegraphic communication with Calcutta, whereby the viceroy was kept informed of what was going on. Of course the mutineers or rebels destroyed or disrupted the wires wherever and whenever they could ; and to repair the damage thus inflicted formed no small part of the arduous duties of the British officers.

Our little but expensive war in Abyssinia in 1868, marked by a less shedding of blood than almost any other war in modern times, was an engineers' war from first to last. A wild and unknown country was surveyed and accurately mapped out, four hundred miles of road constructed, tube-wells sunk, photographs of various useful kinds, taken, and a telegraphic system established. The telegraphic arrangements first made had to be abandoned, owing to the scantiness of the facilities for transporting the necessary materials. The more restricted plan actually adopted was difficult enough, so limited were the means of obtaining wood for telegraph poles. On approaching Magdala, however, Captain St John

(who had the management of this part of the engineering) succeeded in laying down from five to ten miles a day. Short as was the war, this telegraph conveyed more than seven thousand eight hundred messages during the five months of its working, and aided most materially in giving effect to General (now Lord) Napier's well-planned and successful scheme of operations.

Our strange Ashanti War gave further evidence of the formation of a telegraph line through a wild country inhabited by a barbarous people. Lieutenant Jekyll, who had the management of this work, has given a lively account of the difficulties that beset him, and his mode of overcoming them. It was at first intended to fight the war with native levies and to lay down a railway ; but Sir Garnet Wolseley, on landing to take the command, soon found that the natives were not sufficiently reliable, that the country was almost impracticable for a railway, that he must have English troops, and that an electric telegraph would be a highly useful aid. Lieutenant Jekyll, with a small staff, went inland and bought bamboo canes of the blacks, set them up as posts, and laid his wires from Cape Coast Castle to Coomassie at the rate of about two miles a day. A gang of fifty natives helped him. Of these worthies he says : ' They were not promising in appearance, and I was compelled to dispense with the services of those who were *less than four feet high* ! (We italicise these words to shew what pigmies many of the West Africans are.) But they had with them an intelligent headman ; and by dint of supervision, supplemented by a little flogging once now and then, turned out a tolerably useful body for light work, as niggers go.' The line was extended by degrees as far as Accrofumum, about a hundred miles from the coast. An amusing proof was afforded of the tendency of the natives to regard the telegraph as a kind of fetish, charm, or spell. The English one day saw bits of white cotton-thread suspended from tree to tree for several miles, as if to obtain thereby some of the mysterious benefits which the white man evidently expected from the wire. When the native helpers received small electric shocks occasionally, consequent on the testing or using of the line, they made sure that a charm was at work ; and the lieutenant was half afraid his men would run away in terror. The climate was very trying to the English, who, lying ill with fever, got the natives to rouse them when any movements of the receiving apparatus were observed. Nevertheless, this telegraphic line rendered services much more than compensatory for the expense, difficulty, and anxiety of laying, maintaining, and using it.

The truly wonderful and eventful Franco-German War of 1870-1 exhibited the value of electro-telegraphy with a completeness never equalled before or since. A foretaste had been given in the Austro-Prussian or 'Seven Weeks' War' of 1866 ; when four complete and distinct telegraphic organisations were adopted—one with

Prince Frederick-William's fine army; one with that of Prince Charles; one at the king's headquarters; and one in reserve. Each could lay down wires as fast as the headquarters could advance. The speedy termination of the war averted the necessity of constructing field-telegraphs, such as those about to be described.

When the German forces advanced to Paris in the closing months of 1870, the plan pursued with the telegraph was as follows: The ordinary commercial and railway telegraphs were gradually extended over the frontier into France, as the German armies advanced. The field or *étappen* telegraphs maintained communication between the base of operations, the ammunition dépôts, and the advanced columns of the various army corps. When the sappers and miners had pushed on to the vicinity of Paris, the ubiquitous wire travelled with them. The materials used were light and simple; the operators employed to transmit and receive messages had been trained in the state establishments; and headquarters were kept instantly informed of any observed movements on the part of the French. The telegraph was indeed in constant use by the Germans—for arranging the transport of ammunition; for hourly communication with the commissariat; for directing the conveyance to Germany of sick and wounded, as well as prisoners; for regulating the traffic on the field railways; for maintaining unbroken connection between the troops, which formed a belt of ninety miles' circumference around Paris; for summoning reinforcements to any point where suddenly needed; and to send news of any gap in the continuity of the immense ring of soldiers encircling the beleaguered city.

If any evidence were needed of the invaluable services rendered by the electric telegraph in the war just noticed, it was furnished by M. Von Chauvin, who attended before a Committee of the House of Commons on Postal Telegraphs in 1876. He stated in distinct terms that the war could not have been carried on without this potent aid.

Our own English system of war telegraphy, organised at Chatham, has been improved from time to time. Light iron telegraph poles are provided, to support insulated wires. There is a travelling office on wheels for the operators; while the materials are carried in specially constructed wagons. So strong is the wire that wheels may go over it; and therefore the line is laid above ground or on the ground according to circumstances. Spikes of peculiar form enable the wires to be hung on trees or walls to meet the contingencies of towns and villages. The nucleus of the staff of operators is a small body of Royal Engineers, under their own officers, comprising about fifty military men, with occasional assistance from others—well organised into superintendents, inspectors, clerks, linesmen, storemen, artisans, and labourers. The wagons for materials contain drums on which the wire is coiled; this is unrolled as the wagon moves on, which is as fast as the operators can lay the line. At the present time, ten thousand miles of prepared wire are said to be kept in store, ready for any exigencies.

We might go on to notice the aid furnished to warlike operations by the electric light; as for instance, at Paris in the closing weeks of 1870, when such a light on Montmartre enabled the

Parisians to gather some knowledge of what the besiegers were about at night. But enough: the brief summary above given will suffice to shew how electricity is used in war.

NEARLY WRECKED.

CHAPTER III.—WILFRED'S LETTER.

TIME went by, and nothing happened to justify Mabel's fears. Wilfred seemed to be working hard and getting on well. His talent was pronounced unmistakable by the master under whom he was placed, and he himself was in good spirits about his future. But before very long matters began to change. His letters to Mabel were less frequent and shorter than they had been; he spoke with less openness and frankness of his doings; and it was evident to her that there was a *something* which he was careful to keep from her.

She longed to see Mr Merton, to hear from him what news he had of his son, and whether his ideas about Wilfred corresponded with her own; but she dared not speak to him about it. She knew how hard he had always been to Wilfred, how intolerant of all his faults; and she knew well there would be little mercy to be hoped for him at his father's hands if, as she suspected, he had been taking more to pleasure and less to work lately. She dared not even speak to her father of what she feared, for could she expect even him to think as leniently of her dear one as she did? So she had to go on from day to day keeping her trouble—which was not less difficult to bear because it was only suspected—to herself.

At last, when Wilfred had been about nine months in Paris, but too certain proof arrived of how true her suspicions had been. Mr Colherne was staying away from home—a very unusual proceeding, and Mabel was left alone. He had gone to pass a few days with a friend in Scotland, whither it had been impracticable for his daughter to accompany him.

The morning after his departure, Mabel came down to breakfast rather later than usual, singing a snatch of one of her favourite ditties, and burst open the dining-room door in a way that was indicative of her lively feelings. Her eye lighted upon a letter that was lying in her plate; the writing was that of Wilfred Merton. The missive was almost illegible and very brief, and acted upon her gay spirits like a sudden freezing. It ran as follows:

MY DARLING MABEL—I must write a few words, the last you will ever have from me, to tell you that whatever may appear, however any one may try to persuade you, I still love you; love you, as I have done all my life, with all the best part of my nature. Believe that, Mabel, my own, always. I write to say good-bye, for I shall never see you again; and yet I never longed to see you as I do at this moment. I feel half mad now, and hardly know what I am writing. How shall I say it; I have nothing to live for, except disgrace, and I will not live for that, I am resolved. Once more, good-bye, dearest and best. Try to forgive me, and then forget me, as every one else in the world will soon do. WILFRED MERTON.

For an instant Mabel sat quite still, gazing straight before her with one expression, that of blank despair, upon her face. This sudden fearful shock had quite stunned her. But she was not a girl to remain inactive, simply grieving over misfortune, when there was anything to be done. Her resolution was promptly taken. She rang, and a servant appeared.

'Tell Hawkesley to bring the brougham round as soon as he possibly can,' she said; 'tell him not to mind how it looks, but to be at the door as soon as possible.'

'Is anything the matter, miss?' said the man, astonished at this order.

'Yes. I have no time to lose.'

'Is it master, miss?' he asked, with that dreadful habit of his class of questioning instead of doing what is wanted.

'No; papa is quite well. But don't stop now; go yourself to the stable; I haven't a minute to waste.'

In a few minutes more she was seated in the brougham which was fast making its way to Mr Merton's bank in the City.

CHAPTER IV.—THE JOURNEY.

Mr Merton was sitting in the private office of his counting-house with a large book open before him. Just as he was in the middle of some calculation which, to judge from the expression of his face, was pretty abstruse, the door opened and a clerk entered. The banker looked up with no appearance of being pleased at the interruption.

'What is it, Mr Chester?' he said, rather angrily.

'There is a young lady, sir, who says she must see you as soon as possible, and alone.'

'O nonsense. I can't possibly attend to her. Don't you know who she is?'

'No, sir; she wouldn't give me her name, nor tell me her business. I said that I was sure you couldn't see her; but she said it was absolutely necessary that you should do so, and that you would know her directly.'

'You must tell her that it is out of the question for me to see her, if she will not send word who she is, or what she wants.'

'There's no good, sir; I have told her so. But she is quite determined to come; and I thought I had better speak to you, as it seemed so strange to have her waiting about there.'

'Well, in that case I suppose you must shew her in.'

The clerk withdrew, and in an instant returned with 'a young lady who had a thick veil over her face. Having ushered her into the room, he withdrew and shut the door, leaving Mr Merton and his visitor alone.

No sooner was the door closed than the lady put up her veil and disclosed the features of Mabel Colherne.

'Why, Mabel!' said Mr Merton, appearing considerably more surprised than pleased at finding who his visitor was; 'what in the world brings you here?'

Mabel for her only answer put Wilfred's letter into his father's hands. He read it through without shewing any signs of either surprise or regret, and when he had finished it, handed it back to her without speaking.

'Well, Mr Merton?' she said, feeling impatient at his silence.

'Well, Mabel?' he returned.

'Have you read the letter?'

'Most certainly.'

'And have you nothing to say?'

'What am I to say?'

'Mr Merton,' exclaimed Mabel, hardly able to control herself, 'can you read such a letter from your son, and not care about it?'

'I have given up thinking of Wilfred as my son at all, Mabel. I gave him the chance of rising in his odious profession by sending him to Paris, and what has been his conduct in return for my kindness? He has done nothing but amuse himself, and get into all kinds of disreputable mischief. I should have told you all this before, and tried to persuade you to break off with him; but I did not do so; in the first place, because I was sure you would not listen to me; and in the second, because I did not want to be the means of cutting him off from your affection, and thus rendering his amendment impossible.'

'I have been afraid that something has been going wrong with Wilfred lately. I wish you had told me before; I might have been able to influence him for good.'

'I don't believe that any influence in the world would be useful to him; he is a thoroughly worthless fellow. I paid his debts once upon condition that he would contract no more, but I might have saved myself the trouble; within a month he wanted more money. I was not going to be guilty a second time of the weakness of saving him from difficulties he had brought upon himself, in spite too of all my warnings; so I wrote back to say that I would have no more to do with him.'

'Mr Merton, you will not keep to such a cruel resolution now, with such a letter as this before you?'

'Are you so weak, Mabel, as to be taken in by such nonsense as this? Don't you see that being unable to get at me, he is simply trying what he can do with you?'

'No, Mr Merton; I don't believe that, and won't for a moment. I trust my own instinct, which is a woman's natural guide, and generally a very sure one, and I am certain that Wilfred intends doing something desperate.'

'I have told you before now that my son is a foolish weak fellow, and not worth anybody's love.'

'What is that to me, Mr Merton?' exclaimed Mabel, exasperated beyond endurance. 'I love him, and I can hardly be expected to stand quietly by and let him be ruined, because the affection you ought to bear your son is wanting in your nature. Who knows but that the treatment he thus received under his own father's roof may have'—

'What do you wish me to do? What is there that can be done?' cried Mr Merton, interrupting the girl's impassioned burst.

'I want you to go with me to Paris to see Wilfred, that we may take him away from harm, if it be not too late. If papa had been at home now, he would, I am sure, have gone with me; but I could not wait till he comes.'

'You can hardly be serious in proposing for me to go on such a wild expedition as that, I think?'

'Mr Merton, I am quite sure that that letter means more than you think; and I am determined that he shall not be left to be ruined without an attempt to save him. If you will not come I must and will go alone.'

'You are mad; Mabel! Go to Paris alone, and to see this worthless fellow! What do you suppose the world would say of such conduct?'

'I can't think of that when the person I love best on earth is in such danger, as I am sure Wilfred is now, and there is a chance, however faint it may be, of my saving him. I can answer to heaven and my own conscience for what I am going to do, and I must brave the world. I shall write and tell papa what I have done, and I am sure that he will follow me as soon as possible. Good-bye, Mr Merton; there is no use in my stopping here longer.'

'Stay, Mabel!' he began, detaining her as she rose. 'I cannot possibly allow you to go alone, and I have of course no power of interfering with your actions. If you really are bent upon this scheme, which I still think an utterly mad one, I must, for the sake of my own reputation as much as for yours, accompany you.'

'Believe me that my fears are not uncalled for. I am sure something dreadful is going to happen to Wilfred, and I only dread being too late even now. I am very thankful you are going with me; and am certain that you will never repent it.'

'No thanks: it is only necessity that makes me do it. When do you start?'

'To-night, if possible.'

Mr Merton looked into a Bradshaw that was lying upon the table. 'The train to meet the night-boat leaves London at half-past eight; to catch that you must start from your house at half-past seven.'

'I will do that. Will you meet me at the station?'

'Yes; I will be there at a quarter past eight.'

'Good-bye till then; and thank you again a thousand times.'

Mr Merton attended her to the outer door of the office, and she drove home well satisfied with her mission. Writing to her father, to tell him everything, and what she was going to do, she packed a small box to take with her, and then did little else but wish the day, which seemed interminable, gone. Long before it was necessary, she was at the station; and punctual to the appointed minute, Mr Merton appeared.

After a journey that to Mabel seemed endless, they at length reached Paris, and drove straight to the hotel in which Wilfred lived.

As they stopped, Mr Merton said: 'You may depend upon it we shall find our trouble wasted, and that the object of your anxiety is out somewhere amusing himself.'

Mabel did not answer. She could hear her heart beat as she sprang out of the cab; and without waiting for her companion, entered the court-yard of the hotel, and went to the den appropriated to the *concierge*. That gentleman was reading a newspaper, in which he seemed much interested, and did not look up as she came near him.

'Monsieur Merton, est-il chez-lui?' she asked breathlessly.

The *concierge* put his finger against the word he was reading, in mute protest against being interrupted, and looking slowly up, said rather dreamily: 'Plait-il, Madame?'

'Monsieur Merton, est-il chez-lui?' she repeated more eagerly than before.

The man turned round, and walking with the most provoking deliberation to the other end of the room, where numerous keys were hanging,

looked at the place appropriated to the one belonging to Wilfred's room, and seeing that it was unoccupied, came back to Mabel and answered: 'Oui, Madame.'

'Quel est le numéro de sa chambre?'

'Soixante-deux, au cinquième,' said the *concierge*, returning to his paper as he finished speaking.

Mr Merton had paid the driver and joined Mabel as this conversation came to an end, and they started to mount the stairs to the fifth floor as directed.

Even Mabel's youth and energy could not prevent her from getting out of breath in that long climb; and by the time she and Mr Merton had arrived at the fourth floor, they were obliged to stop and rest.

Before they had stood an instant, they were startled by a loud report of a pistol coming from the floor above them. With a loud scream, Mabel sped up the remaining stairs and entered the room named by the *concierge*.

Mr Merton came almost instantly after her, and found Wilfred lying insensible on the floor, and Mabel kneeling by his side, trying to restore consciousness.

CHAPTER V.—SAVED.

Within an hour, two of the most skilful physicians that Paris could boast were with Wilfred Merton. And when they left him, their verdict was not one to give much hope. He had shot himself in the chest, and it was very doubtful whether he would recover from that fearful self-inflicted wound.

Mr Merton's anguish during those long days and nights while Wilfred lay at death's door was terrible to behold. Alienated as had been his affection for his son while absent, the feelings of parental love returned tenfold, now that he might be on the point of losing that son for ever; and as he nursed his boy with that womanly gentleness which is so touching in a man, it was evident that his whole hope of happiness was bound up in his recovery.

Mr Colherne had, as Mabel predicted, lost no time in following her to Paris, and though he could hardly feel the intense and painful interest in the invalid that his father felt, still for Mabel's sake he became a willing sharer in the nursing.

As for Mabel, hope was very strong in her, and made that time of watching much easier to bear. She could not help believing that that strong determination to cross the Channel had been put into her mind to enable her to save the one who was so dear to her; and in that belief she put her trust.

At last, after long, weary, sometimes almost despairing watching, the patient took a favourable turn. The burning fever ceased; and one day the doctor told the anxious watchers that there was great hope; that indeed, unless any unforeseen complications arose, there was nothing further to fear.

Then the pent-up feelings of Mr Merton—that grief which he had tried so unsuccessfully to conceal from his companions, could be kept in no longer; he threw his arms round Mabel's neck, buried his face on her shoulder, and burst into tears, those tears which, when shed by a man, are so inexpressibly painful to see.

'Mabel,' he said, 'I owe all this to you; if it had not been for you, I should have been my son's murderer.'

Mabel pressed her lips upon his forehead in silence; her heart was too full of thankfulness for speech.

Wilfred was very patient, and manfully bore all the trials of the time. As soon as he was well enough to be able to think of what he had done, a feeling of intense remorse had come over him, and had taken such powerful hold that at first it threatened to throw him back. But the gentle hand of Mabel was a wonderful restorer; a word or two of loving assurance changed this bitter remorse into a quiet sorrow. It happened one day, about a week after this, that while Mabel was reading at the window of the invalid's room, she heard Wilfred's voice gently calling to her. It was as if the voice of her lover had been suddenly restored to him.

'Can you forgive me, my darling?' he asked.

'Am I not a woman, Wilfred? And is it not a woman's privilege to forgive?'

'I don't think you are a woman, Mabel; I think you are an angel.' Few words, but conveying volumes.

From that moment her lover began to mend steadily, though still slowly; every day there was more and more to hope, until at length Wilfred was pronounced wholly out of danger. And then one evening in the dusk, when the lamps were being lighted in the street below them, and the increased hum and buzz of the later day were coming on, Wilfred and Mabel found themselves again alone.

'Mabel,' he said in a low voice, when they had been quite silent for a long time, 'I have been wanting an opportunity to tell you all the wrong that I have done. Shall I tell you now?'

'Yes, Wilfred, now—in this twilight light.' She slid her hand into his as she spoke, and they remained in that position while he told her his story.

There was nothing new about it; it was the old story. Led by bad companions into temptations, his naturally lively and weak nature was not able to resist; ashamed of himself for his own conduct when he found himself outrunning his allowance, and obliged to apply to his father for help. Thrown into despair by his father's harsh conduct to him, he had plunged still more wildly into the excesses and dissipations of his leaders, till at last, horrified at what he was doing, and seeing no means of escape from the snares in which he had allowed himself to be caught, he had written that letter to Mabel; had waited, vaguely hoping for he knew not what, for some days, and had ultimately sought to put an end to himself in a fit of intense depression. Weakness, that shoal which is even more fatal, because more hidden than wickedness, had wrecked him, as it has wrecked so many. In the deep remorse that he now felt, he greatly exaggerated the wickedness of his conduct, for though he had been guilty of grievous folly, he had done no positive or irremediable wrong either to himself or others. The only actual definite sin he had committed was the suicidal one, from the consequences of which Mabel's resolution had happily saved him.

When he had finished this history, he paused an instant, and then added, without looking at her:

'And now, Mabel, that you have heard all this, do you still say that you forgive me? Can you still love me?'

'A love would be very useless, Wilfred, that deserted its object just when it was most wanted; I hope my love is a truer one than that.'

'Mabel, my beloved,' said he, drawing her closer to him as he spoke, 'if it had not been for you, I should have been beyond the power of repentance now. Your affection has saved me once, and it shall keep me from harm now, for ever!'

Before very many years had gone by, Wilfred Merton's name was known as that of a successful young painter. He and his wife were settled in London, and were able to live in very comfortable style. They had no children, which was their only serious drawback to happiness; but if ever Wilfred, seeing his wife look longingly at some merry group of little ones, and guessing her thoughts, tried to console her, she would put her hand into his and say, her truthful eyes looking full at him as she spoke: 'I have you, Wilfred, beside me, and I am content.'

The foregoing narrative, which is founded upon events which actually took place, may be turned to advantage by those parents who are prone to thwart the natural inclinations of their children, or cut them adrift without a proper guide. The career of many a man has been blighted by the mistaken, though perhaps well-meant policy of a father who, desirous to see his son follow up his own profession, has tried to compel that son to work contrary to his inclination, with results more or less disastrous.

GEMS AT RANDOM STRUNG.

THE history of precious stones, those beautiful objects which have strongly appealed to the imagination of men in all ages, has been written many times; and yet their latest chronicler is doubtless justified in assuming that the knowledge of them in its practical sense is not widespread; that even in the jeweller's trade there are many who are not skilled in detecting the real measure of difference between one stone and another, either by the specific gravity, which supplies the essential test, or by the minor tests of rarity and quality. In treating of the history and distinguishing characteristics of *Precious Stones and Gems*, Mr Streeter has certainly conferred a benefit on 'the trade;' to the general reader the book can hardly fail to be of interest, for it puts a captivating subject before him under a variety of aspects, and appeals successfully to imagination as well as to taste for exact knowledge.

From the magnificent specimens which the rescued Sindbad carried away with him when he tied himself with his turban to the roc's leg, on through a long succession of fable and of history, diamonds will never cease to enchant mankind, having always taken the lead in interest, as they have been supreme in value among those treasures of the mineral kingdom which are called gems or precious stones. Ages before men discovered that their beauty could be enhanced by handiwork, their rarity and their price had endowed them with a surpassing charm; and now, when handiwork has been brought almost to perfection, and science has dispelled the mystery with which

the diamond was invested, they maintain their immemorial supremacy. In company with Mr Streeter we may trace the beautiful things from their habitat in India, the Brazils, South Africa, the Ural Mountains, and Australia, through their history in the ancient times and in medieval days, when they formed the theme of many fables and the object of much superstition.

The diamond dwells in the same lands and in the same strata with many other gems, but it is the most precious as it is the most difficult to find; and though its nature resembles theirs in many respects, in one it is unique—it is the hardest of all known substances, and belongs to those bodies which refract light most strongly. Its magnifying power is greater than that of glass; but it is seldom used for microscopic lenses, owing to the great difficulty of making them perfectly accurate. It was believed to possess double refraction, but that has been disproved; and the deviation which gave rise to the error is traced to the existence of internal air-bubbles, as in amber, by which the course of the light is altered. It is the triumph of cutting to exhibit these qualities to the highest degree, and thus did Babinet, a great authority on diamonds, test them. 'In a sheet of white paper he bored a hole somewhat larger than the diamond to be tested: he let a ray of sunlight pass through the hole, and holding the diamond a little distance from it, yet at such an angle as to allow the ray to alight on a point of the flat facet, he found this facet to be forthwith represented on the paper as a white figure, whilst all around little rainbow circles were delineated. If the observer found the primary colours red, yellow, and blue definitely separated one from the other in these little circles, and if their number were considerable, and they stood at equal distances from each other, then he pronounced the brilliant to be well cut.'

From Mr Streeter we learn that in commercial estimation, coloured gems stand far behind the diamond; inasmuch, he tells us, that this stone represents ninety per cent., and the others altogether only ten per cent. of the quantity on sale. A hundred years ago, Brazil became the rival of India in the production of diamonds, and the finders were the poor mulattos and negroes, who explored for them the sterile wilds of Minas-Novas, and sold them to the merchants. The story of the discovery of these gems at Bahia is as follows: A slave who came from Minas-Geraes was tending his master's flocks in Bahia, and he noticed that the soil resembled that of his native place. He groped in the sand and found seven hundred carats of diamonds. He ran away, and offered the gems for sale in a distant city. Of course such wealth in the hands of a slave aroused suspicion, and the negro was arrested and sent back to his master, who tried in vain to come at a knowledge of his secret. At last he bethought him of sending the slave again to tend his flocks at Bahia, and he watched him. Again the slave-shepherd groped in the gem-hiding sand, and the truth was discovered. Then came numbers of wealth-seekers from Minas-Geraes and other parts of Brazil, so that the next year twenty-five thousand men were diamond-hunting in Bahia, and the amount daily obtained for some time rose to one thousand four hundred and fifty carats. The trade was a

prerogative of the Portuguese crown, and Lisbon was the chief emporium of the gems. The precious things are of fluctuating value. In 1836 they were very dear; but in 1848 the price fell; and a few years ago there was 'a glut in the market,' in consequence of Dom Pedro's having paid the Brazilian state debt to England in diamonds instead of money, when the price fell fifty per cent. in the Leipsic market.

Mr Streeter, who has great faith in the future of Queensland as a diamond-field, gives a most interesting account of the discoveries in New South Wales, that wonderful colony, whose long-delayed luck has come at last, and from all sides at once; but dwells at length and with exultation upon the Cape diamond-fields. 'South Africa,' he says, 'is richer, and its produce is far more to the purpose of modern history, and to the supply of the precious stones, which form our wealth of gems, than the old diamond-fields of the East or West.' The history of the discovery of gems in the colonies partakes of the romance which attended the discovery of gold; and is not free from the tradition of crime and misfortune, which rests upon similar revelations in the Old World. Idle as are the superstitions which impute specific evil influences to certain gems, it is not to be denied that there have been many instances of 'fatal jewels;' and that cruelty, injustice, and terrible human suffering have attended the rifling of the earth's bosom for those mysterious treasures formed by her wonderful chemistry from an invisible component of the atmosphere. Many of the strange stories of medieval alchemists deal with the attempt to make diamonds, and Mr Streeter tells us of the experiments which have determined their nature and combustibility. There is a fascination to the imagination in the following description of the burning of diamonds:

'In 1750 the Emperor Francis I., at Vienna, subjected, in the presence of the chemist Darzet, diamonds and rubies worth six thousand florins to the heat of a smelting-furnace for twenty-four hours. The diamonds were found to have totally disappeared; but the rubies remained, and appeared much more beautiful than before. In 1771 a magnificent diamond was burned at Paris in the laboratory of the chemist Macquer. Hence arose a great discussion. The diamond had disappeared; but whither? Had it volatilised? Had it burned? Had it exploded? No one could say. Then stepped forward a celebrated jeweller, by name Le Blanc, who asserted the indestructibility of the diamond in the furnace, stating that he had often placed diamonds in an intense fire to purify them from certain blemishes, and that they had never suffered the smallest injury.' (This has been done also by Mr Streeter with similar results.) 'The chemists D'Arcet and Bonelle then demanded of him that he should make the experiment on the spot in their presence. He took some diamonds, inclosed them in a mass of coal and lime in a crucible, and submitted them to the action of the fire. He had no doubt that he should find them safe. At the end of three hours, on looking into the crucible, they had utterly disappeared.'

Then appeared upon the scene the famous Lavoisier, he to whom the Convention refused a fortnight's reprieve from the guillotine, just as he was on the threshold of a probably sublime discovery in the science of light; Fouquier-

Tinville returning him for answer that the Republic had no need of chemists and *savants*. In the presence of Lavoisier, Maillard, another jeweller, took three diamonds and closely packed them in powdered charcoal in an earthen pipe-bowl in a strong fire; and when the pot was taken out, there lay the diamonds in the powdered charcoal untouched. It was, however, gradually discovered that it was only by entirely shutting out the air, and therefore the oxygen with which the carbon combines, that the diamonds were preserved from burning; whereas by the simple admission of air, of which oxygen is a constituent part, diamonds burn just the same as common coal. This was proved by Lavoisier in 1776; and Davy subsequently shewed that the diamond contains no hydrogen. So, when the most precious object which the earth produces is burned, the gas formed from its combustion is just that which our fires and our gas-burners yield, and our own bodies too, by the combustion which attends their living; and, says Mr Streeter, 'the old fable of the maiden from whose lips fell diamonds, may have a really scientific basis after all.' It takes immense heat to burn a diamond, and if it were possible to collect the black material which covers the surface during the process, it would be found to be simply soot.

The origin of the diamond is still a matter of scientific investigation and dispute; and the various opinions concerning it may be collected under two heads: (1) The diamond is formed immediately from carbon or carbonic acid by the action of heat. (2) It is formed from the gradual decomposition of vegetable matter. The various methods by which the supporters of the respective theories suppose the transformation to have been wrought, are full of interest and suggestion. In Brazil it was discovered that the matrix of the diamond is itacolumite, and it is said that the gems obtained from itacolumite sandstone have rounded angles and corners, whilst those from the sandy schist are perfect crystals. 'If,' says Mr Streeter, 'this be a fact, we must believe that the agency which changed the sandstone into itacolumite acted also on the diamond.'

Whether in the mines or by the rivers, whose 'golden sands' are flecked with gems, in rich Brazil, the labour of procuring these beautiful gems is great, and large specimens are rarely found; so rarely, that big diamonds have their histories—terrible histories too often—like heroes and race-horses. They are weighed by the carat, a word which Mr Streeter considers to have been derived from the name of a bean, a species of *Erythrina*, which grows in Africa. 'The tree which yields this fruit is called by the natives "kuara" (sun), and both blossom and fruit are of a golden colour. The bean when dried is nearly always of the same weight, and thus in very remote times it was used in Schangallas, the chief market of Africa, as a standard of weight for gold. The beans were afterwards imported into India, and were then used for weighing the diamond.' It is estimated that in ten thousand diamonds rarely more than one weighing twenty carats is met with, while possibly eight thousand of one carat or less may be encountered. An elaborate system of rewards and punishments is adopted in the Brazilian mining and river-searching works; but it is believed that in spite of this, one-third of

the produce is surreptitiously disposed of by the labourers.

The histories of those world-famous diamonds the Sancy, the Regent, the Koh-i-noor, the Blue (or Hope) diamond, and others, have been related before, and history and romance have dealt with the misery and crime, the evil passions and the mystic fancies, involved in the stories of some of these. In a few lines Mr Streeter gives a sketch of the Brazilian contribution to this many-chaptered story, which is not generally known. 'The discovery of these precious stones in 1746,' he says, 'proved a great curse to the poor inhabitants of the banks of the diamond rivers. Scarcely had the news of the discovery reached the government, ere they tried to secure the riches of these rivers for the crown. To effect this, the inhabitants were driven away from their houses to wild far-away places, and deprived of their little possessions. Nature itself seemed to take part against them: a dreadful drought, succeeded by a violent earthquake, increased their distress. Many of them perished; but those who lived to return on the 18th May 1805, were benevolently reinstated in their rightful possessions. Strange to say, on their return the earth seemed strewn with diamonds. Often the little ones would bring in between three and four carats of diamonds.'

Next to the diamond comes the oriental ruby, and in former days it was more prized than the gem, which has a genus all to itself. The ancients gave immense sums for fine specimens of the ruby variety of 'corundum,' or aluminous stone. In Benvenuto Cellini's time a perfect ruby of a carat weight cost eight hundred crowns, whilst a diamond of like weight cost only one hundred. The two most important rubies ever known in Europe were brought to England in 1875. One was a dark-coloured stone, cushion-shape, weighing thirty-seven carats; the other a blunt drop-shape of 47½ carats. Mr Streeter thinks that the London market would never have seen these truly royal gems but for the poverty of the Burmese government; and adds an interesting account of the estimation in which rubies are held in the distant Land of the White Elephant. The sale of the two rubies caused such excitement that a military guard had to escort the persons who conveyed the precious packet to the vessel. No regalia in Europe contains two such rubies. The smaller was sold abroad for ten thousand pounds; the larger has also found a purchaser, but Mr Streeter does not tell us at what price. The great ruby of the kings of Burmah is said to be as large as a pigeon's egg, and of wondrous quality; but is a treasure which no European eye has ever seen. Very few rubies pass out of the country; the king is excessively fond of these gems, and prohibits the export of them. The Burmese have strange notions about rubies; 'they believe that they ripen in the earth; that they are at first colourless and crude, and gradually become yellow, green, blue, and last of all red—this being considered the highest point of beauty and ripeness.'

The sapphire, the emerald, and the opal (the last erroneously supposed to exist in India, whereas it is found almost entirely in Hungary), the turquoise, and the cat's-eye (a rare variety of the chrysoberyl, and inferior in hardness to the diamond and sapphire only), are, each in

its turn, the subjects of Mr Streeter's lucid and learned exposition; after which he passes to the less valuable classes, pearls, onyx, and the gems used for engraving and other purposes. The increasing estimation in which the true Ceylonese cat's-eye is held (it is one of the most fashionable gems at present, and there are specimens in the market worth upwards of one thousand pounds), renders the following particularly interesting: 'In India the cat's-eye has always been much prized, and is held in peculiar veneration as a charm against witchcraft. It is the last jewel a Cingalese will part with. The specimens most esteemed by the Indians are those of a dark olive colour, having the ray so bright on each edge as to appear double. It is indeed wonderfully beautiful with its soft deep colour and mysterious gleaming streak, ever shifting, like a restless spirit, from side to side as the stone is moved; now glowing at one spot, now at another. No wonder that an imaginative and superstitious people regard it with awe and wonder, and believing it to be the abode of some "genius" or djinn, dedicate it to their gods as a sacred stone.'

THE INN AT BOLTON.

WHEN I was a little boy—I am now an old man of sixty—'Aunt Oliver,' as we used to call my father's widowed sister, was in the habit of paying long visits at my father's house. She had not long been a widow; and though past the meridian of life, was still a beautiful woman. But what made her so exceedingly popular with all my father's children was her repeated kindnesses, displayed to us in the shape of various useful and ornamental gifts, carefully chosen to suit our several ages and characters; but above all, her wonderful condescension in giving up her own pursuits on many a winter's night, that she might recount to us, as we sat grouped around the nursery fire, some of the incidents of her varied and eventful life. She had been a great traveller in her day, having been to Rome, and even visited the Holy Land; and what is more, she had written a book of travels! a circumstance which caused us to regard her with a strange curiosity almost amounting to awe; a feeling on our part which, but for her uniform kindness, might have detracted from that universal love we one and all bore towards her. One of my aunt's adventures made a strong impression on my youthful mind, and is even now, after a lapse of half a century, still fresh in my recollection. Thinking it might serve to divert those who have a fancy for the humorous, I have gathered up the threads of the story from the storehouse of my memory, and now present it in narrative form, under the foregoing title.

My uncle, Mr Oliver Brown, was in the iron trade; and in connection with his business, which was a very large one, was in the habit of paying periodical visits to the manufacturing town of Bolton, near to which his principal iron-works were situated. He usually paid these visits alone; but on the occasion of which I am about to speak he was accompanied by my aunt, who deemed it her duty to be with her husband, as it was winter-time and he had only just recovered from a severe illness. It was late in the evening of a bleak November day that the coach which conveyed Mr

and Mrs Oliver Brown from their comfortable country-seat, distant some fifty miles from Bolton, entered the noisy ill-paved streets of that bustling town, and proceeded to what at that period was the principal inn of the place. Both travellers were tired by their journey, and after a hasty dinner, were glad to retire to rest.

'Did you say number twenty-seven, second floor?' inquired Mrs Oliver, addressing the lady at the bar, as she took a chamber candlestick from her hand and proceeded to mount the stairs.

'Twenty-seven, second floor,' responded the landlady with an affirmative nod and a gracious smile.

'Twenty-seven, second floor,' repeated my uncle as he followed in the wake of his more active and enterprising helpmate, who, threading her way up the spiral staircase and along a labyrinth of corridors and passages, had already arrived at the dormitory in question. Mr and Mrs Oliver were soon in bed; and there we will leave them, whilst we look in at number twenty-nine on the same floor, and make the acquaintance of Mr and Mrs Wormwood Scrubbs, the occupants of that apartment. They, like their neighbours at number twenty-seven, were in comfortable circumstances, and like the latter, not much given to travelling for pleasure's sake on a cold raw day in November; but an affair of business which demanded their presence at Bolton had compelled them to sacrifice their ease and comfort, and come to that town on this bleak November day. Mr Scrubbs had long been subject to attacks of gout in the foot; and as he had heard of this disease having a tendency sometimes to shift its seat to the brain or the stomach, when it was apt to assume a more serious type, he had made it a rule to carry about his person in the daytime, and to place under his pillow at night, a certain medicine which an eminent physician had assured him would speedily arrest any such erratic tendency on the part of the malady from which he suffered.

Now, on this particular night, whether from over-exertion, exposure to cold, or some other cause I know not, Mr Scrubbs happened to be visited with certain premonitory symptoms of an approaching attack of gout, whereupon he instinctively felt under his pillow for the valuable specific I have referred to. He then remembered he had inadvertently left it in the pocket of his greatcoat, which he had thrown upon the sofa in the private sitting-room into which Mrs Scrubbs and himself had been ushered on their arrival at the inn; whereupon, being unwilling to disturb his better-half, who was in a profound sleep, he let himself quietly out of bed, and throwing his dressing-gown over his shoulders, proceeded to light his candle. Having done this, he gently opened the door and sallied forth, leaving the door slightly ajar, in order that he might the more easily find the room on his return.

It so chanced just about the time Mr Wormwood Scrubbs was proceeding on the above mission, that Mrs Oliver Brown, who was too fatigued to sleep, suddenly recollected that she had left her reticule with her purse inside it on the table in the room where she and Mr Brown had had their dinner; and wisely considering that it would not be prudent to leave it there till morning, she resolved to descend to the sitting-room and recover the bag at once; accordingly slipping out

of bed, she struck a light, and opening the bedroom door, stepped into the corridor into which it led. She then proceeded to assure herself by a reference to certain figures that were painted over the door-frames of the several dormitories that the room she had just quitted was number twenty-seven and no other; and having satisfied her mind on this point, she left the door ajar, and gliding swiftly along the different passages and down the cork-screw-shaped staircase, soon reached the sitting-room, whence, having found the bag she was in search of, she retraced her steps in the same rapid way, exercising her memory as she went along by repeating the number of the room to which she was returning.

Now Mrs Oliver Brown, who, by the way, had an undoubted bump for localities, had formed an idea—and a very correct idea it was—that number twenty-seven was the second room on the left-hand side of the corridor; but on her return, finding the door of this chamber closed, whilst that of the one adjoining it was open, she not unnaturally supposed she might have made a mistake in regard to the position of number twenty-seven; but in order to set all doubt at rest upon this point, she was about to refer to the number on the door-frame, when a sudden gust of wind sweeping along the whole length of the passage extinguished the candle, leaving her in utter darkness. Thus situated, Mrs Oliver Brown did what most ladies (and gentlemen also, I think) would have done under the circumstances: she groped her way along the passage till she came to the open door of number twenty-nine, went softly in, shut the door in the same quiet way, and got into bed, where, being greatly fatigued with all she had undergone, she soon fell fast asleep.

In the meantime, Mr Wormwood Scrubbs having repossessed himself of his gout mixture, had also returned to the corridor, where seeing a door ajar precisely as he had left his own, he at once went in, closed the door, blew out his candle, and popped into bed, where my excellent uncle was still sleeping as peacefully as a baby, and utterly unconscious of the recent migratory movements of Mrs Brown, which were destined to produce such an unlooked-for disturbance in the domestic arrangements of the two families occupying respectively numbers twenty-seven and twenty-nine.

Mr Wormwood Scrubbs, however, though now quite easy both in body and mind, was unable to sleep, and lay awake, first thinking of one thing and then of another, till he was suddenly recalled to the stern realities of life by hearing his wife's voice proceeding apparently from the adjoining room. In a state of immense perplexity, he struck out with his sound leg in the direction of the sleeping figure at his side, when having come in contact with a plump warm body corresponding to that of his amiable helpmate, he paused, and suspending all further investigation for the present, calmly awaited the issue of events. Nor had he very long to wait.

Mrs Wormwood Scrubbs was a lady of a highly nervous and excitable temperament, with whom, when once roused, it would be about as useless and dangerous an experiment to attempt to argue as with a tigress surrounded by a litter of famished cubs. She had just waked up from her first sleep, when happening to put her hand upon that part of the connubial couch where her Wormwood's head

was wont to rest, she found it brought in contact with a lace nightcap, and a profusion of long curls that had escaped from beneath it.

'Why, what's this, Scrubbs? What tomfoolery's this you're after? What's this, I say?' tugging, as she spoke, at the head-dress of her supposed husband. 'Why, goodness gracious, it isn't Scrubbs after all!'—as starting up in bed, my aunt in gentle but startled accents implored her to be quiet.

'But who are you? and what are you doing in number twenty-nine?'

'Number twenty-nine! Surely this is not twenty-nine, but twenty-seven,' doubtfully returned my aunt, as the idea suddenly flashed upon her that she *might* have mistaken the one room for the other. 'I think I can explain it all.'

'Explain it all! Of course you'll explain it all, and something more than that, before I've done with you, you good-for-nothing impudent hussy that you are!'

'For heaven's sake, be calm, my good woman, or you'll rouse the whole house,' expostulated my aunt in the gentlest manner possible.

'Don't "good-woman" me!' shouted Mrs Scrubbs at the top of her voice, as springing from the bed, she seized the bell-rope and pulled at it with a violence that threatened to carry everything with it. Amid this terrific uproar, Mr Scrubbs and his bed-fellow Mr Brown, who had been vainly trying to make themselves heard from the adjoining room, suddenly appeared candle in hand upon the scene.

As oil cast upon the troubled sea will instantly reduce that element to a state of the profoundest calm, so did the sudden appearance of Mr Scrubbs act as if by a charm to allay in one moment all the angry feelings of Bella Scrubbs, and where only a few moments before all was violence and discord, there now reigned perfect peace and good-will.

The mutual explanations that ensued, it is needless to say, were perfectly satisfactory to all the parties concerned; and after a readjustment of partners, the two families once more took possession of their respective chambers, where I need hardly say they were not again molested during the remaining part of that memorable November night.

ROCKBOUND.

Of the thousands of tourists who flock every year from all parts of the civilised world to gaze upon the picturesque beauties of the Highlands, to muse among the ruined aisles of Iona, or to listen to the diapason of the sea, as it sinks and swells through the pillared caves of Staffa, few, comparatively speaking, care to go so far north as the Shetlands; yet these islands, though generally bare, have a beauty of their own—the breezy, ever-changeable beauty of the sea.

The scientific tourist will not fail to find something to interest him in Shetland. There are bold headlands, wide reefs of black crags, and a flora which, although neither rich nor varied, has charms for the botanist. There are broad stretches of sandy beach, not so sterile as they look, but affording, in hidden nooks and crannies, no bad hunting-ground for a naturalist out for a summer holiday. If you are a member of the Alpine Club, there are here no mountains for you to climb, but there are cliffs such as might

well appal the most practised mountaineer; and in summer there is the sun, shining in a cloudless sky nearly all through the four-and-twenty hours. There in summer, midnight is not like the midnights of more southern climes, but is permeated by the rays of a sun, set indeed, but so soon about to rise, that there is scarcely any absence of light.

If you are a painter, you may have sea-views in abundance. You may choose your own time and place and grouping; early morning if you will, with the white mists rolling in over the shimmering sea, and the clamorous gulls hovering above skerries that are crusted all over with dense clinging masses of sea-weed. Or you may wait till the ascending sun rolls back the curtain of mist, and the sea gleams out before you a wide sheet of burnished gold, spangled with the rocky islets of a storm-swept archipelago. The waves roll in at your feet—long majestic ridges of water, dappled with lines of foam; the wide swell of the Atlantic sweeping in from the far shores of Labrador; while from far inland some tiny streamlet tumbles down to the sea through a natural copsewood of dwarf ash and birch and hazel.

Bold points and headlands stand like brave sentinels far out to sea, sheltering little natural harbours where the fisherman's boat rides in safety. Tiny fiords run inland into deep glens, with here and there a fisherman's hut or a crofter's cottage. Perhaps, however, you may have a fancy for foul weather, when the sky darkens like a pall over the sea, and the storm-fiend rouses himself from his ocean lair, and the tempest-tossed waves scud along in wreaths of foam to break in hoarse thunder upon the shore, or hurl themselves in impotent rage against the face of the steep headland. In Shetland you have grand alternations of calm and storm.

It is perhaps, however, for the student of human nature that Shetland has the greatest attractions. Here he will find a simple, kindly, primitive set of people, of Norwegian descent, but now anglicised in language and usages. They are, however, fond of old legends and stories. Mrs Saxby, the authoress of *Rockbound, a Story of the Shetland Isles*, in a pleasantly told narrative introduces us to this primitive people. We have for the scene of the story an island called Vaalafiel, five miles long, and a little over two in width, with a tiny harbour, and gray old mansion-house set in a strip of scraggy pine-wood. Vaalafiel, Mrs Saxby tells us, 'is coiled upon the sea much in the way a kitten rolls itself together on the hearth-rug—the creature's paws being represented by the narrow belts of land overlapping each other and forming the arms of our voe (fiord), whose crags are very suggestive of claws. Rising abruptly from the shores of this harbour, the island becomes a hill, whose eastern side is a precipice dipping into the German Ocean. The north point terminates in a bold headland, from whence the hill slopes gradually southwards, until it ends in a beautiful stretch of sand, kissed white by the broad waves of the Atlantic. The neighbouring islands cluster north and south, leaving deep narrow channels, where the two great seas keep up a perpetual warfare; and he is a daring sailor who ventures to cross those tideways when their "dark hour" approaches.'

Under the old house of Vaalafiel and the cliffs adjacent to it were wide underground caverns,

such as in the 'good old smuggling times' were no uncommon adjuncts to country houses, and even manse, if they happened to be conveniently near the shore. This smugglers' cave was the scene of a tragedy, such as was of no unfrequent occurrence among desperate men in these lawless days. A hasty blow struck in sudden passion hurried one rash soul to its last account, and darkened as with the brand of Cain the lives of many others. There is an old nurse, full of well-nigh forgotten Norse superstitions, and a little lonely child, the heiress of the rockbound islet, whose dearest pleasure was to watch the sea on the serene summer evenings when the sky became like a poet's dream, and earth and sea put on the glory of the clouds. Mrs Saxby describes 'the Shetland summer night as not dark at all; it is merely a twilight, which is prolonged sufficiently to assume a character of its own. Not dark, not light, not a brief uncertain mingling of both, but a quiet earnest period of rest, when Nature dreams but does not sleep, and yet is not awake. We call it "the dim," and you can discern objects quite clearly while it broods over the earth.' The wild winter nights have a grand storm-driven beauty of their own, when the Aurora Borealis shoots forth a fitful light, and the nursling of the gray North 'catches glimpses of the beauty dwelling in colour.' The solitary child Inga, bearing in her brave little heart the burden of her father's dimly realised crime, yet cleaving to him, because he loves her, with an affection far stronger than that which binds her to her cold unloving mother, develops into a healthy spirited girl. Lonely and prosaic as her life was, it was not, however, without a salutary admixture of holidays and holiday amusements. The lady of Vaalafiel, although a somewhat stern disciplinarian, was wise enough to recognise the truth of the axiom, that 'all work and no play make Jack a dull boy,' and so upon birthdays and such kindred anniversaries she somewhat relaxed the rigidity of her rule. A fat bullock was killed in honour of the young heiress, and Miss Inga's favourite Newfoundland dog ('evidently desirous of contributing his share to the feast) went off one night to the hills and ran down half-a-dozen sheep. It was found that he had performed the service of a butcher in a perfectly scientific manner; so the animals were carried home and added to the larder.'

With such a superabundance of *pièces de resistance*, even the crustiest old bachelor in the world might have found a picnic tolerably enjoyable; and Miss Inga and her young friends had a most delightful day of it in their sweet northern Arcadia, clad as it then was in all its witching garb of summer. 'The sun,' she says, 'rose in cloudless glory, and everything was dipped in sunshine of another kind as well; for Aytoun' (a divinity student quite as fascinating as *The Modern Minister*) 'had returned for the midsummer vacation, and that would have been gladness enough for me. There were with him some of his college companions, who made sparkling speeches, sang hearty songs, assisted in distributing prizes to the winning boats, and then challenged the islanders to a football match. Which played best is an undecided question to this day, for each side had a method of its own; and did not comprehend that of its opponent. Then the people were gathered on a smooth meadow near our house, and the plaintive

Foula Reel called upon old and young alike to join in the graceful and truly poetic dance of Shetland. The natural good breeding of the islanders allowed us to remove every restriction on their pleasure, which was characterised by a hearty enjoyment without the slightest approach to excess.

As unlike as possible to a heroine of romance, the child reared in this homely fashion is yet sweet enough to carry blessing and love wherever she goes; to heal old wounds with her simple beauty and goodness; to carry peace into the unforgiving relentlessness of her mother's heart; and to efface the blackness of her father's crime (justifiable homicide, a soft-hearted jury would resolve it into) with tender penitential tears. Miss Inga is in truth a very lovable character, innocent, simple, and yet intelligent; gentle and winning in her ways, although she can be spirited and resolute upon occasion; full of affectionate respect for her stern mother, and of deep romantic devotion for her father, for whose sake she marries without love, which no properly constituted heroine of romance ever does or can do, but which many a good woman has done, to find, as she did, peace and household joy and contentment at a good man's hearth.

Many of the descriptive passages in *Rockhound* are written with considerable vividness and effect, as for instance the storm, through whose agency a crisis in the plot of the tale is worked out. 'A tempestuous morning was breaking, and sea and wind were uttering wrathful warnings of what might befall the unwary fishers who were out on the deep, and I looked out with eyes which scarcely saw—with a mind on which impressions seemed lost. As if still in a dream, I beheld the furious waves come rolling majestically from the far deep and break with thundering sound upon the rocky arms of our voe. As I gazed, there suddenly appeared round a point of the high land a little vessel with closely reefed sails struggling in the sea between Vaalafiel and its neighbouring island. Her hull was partially concealed from my view by the arms of our voe, but very soon I seemed to know that it must be the *Seamew*, and that she was attempting to enter the harbour; and a thought occurred to me which was suggestive of peril at once: Why do they try to pass through so narrow and dangerous a strait when the storm is at its worst? As if in answer to my thought, the vessel hoisted a flag of distress, probably with a forlorn hope that some wakeful eye might see it, and then she lay to, as trying to advance, in the very teeth of the gale. My father, everything, was forgotten in that breathless moment, as I watched my tiny ship thus turn, pause, and enter the rocky path beset by death. She was evidently being driven by cruel necessity to dare so hazardous a piece of navigation, and I soon discerned that she was no longer manageable. Just then a gust of wind still more furious than before caught her at a critical moment, and in less time than I say the words in, she was tossing among some detached rocks at the entrance to the harbour, a total wreck, and likely to go down every instant.

'I had stood terror-bound till then; but the sight of figures clinging to the spars stirred me to action, and I flew to arouse our servants. They were soon hurrying to the neighbouring cottages, in hope of assistance from any men who chanced to be at

home; and I ran along the shore until I reached the crags opposite where the disabled yacht lay. I was soon joined there by numerous women and a few old feeble men, who shook their heads and groaned when I frantically implored them to launch a boat and go to the rescue. "There's no an able-bodied man in the island wha kens hoo to handle an oar," they cried; "oor men are a' at the haaf" (deep-sea fishing). "The Lord preserve them this awfu' hoor."

Then for a touch of simple pathos, take the neglected child's scanty recollections of her unloved childhood: 'One of the few things I remember is that I always wore a black frock. This circumstance is impressed on my mind, because I had, and still have, a perfect passion for rich gorgeous colours. Nature in the gray North seldom gave my eyes a feast of radiant hues; no brilliant butterflies and flowers clothing the earth in the garments of heaven; no winter clusters of red berries and wreaths of evergreen. There were some old pictures in the house in which scarlet shawls and purple curtains played a prominent part, and I spent a large portion of the time usually devoted to sleep by sensible children in admiring these, and conjuring up fantastic histories of each portrait.'

Altogether, the book is sweet, fresh, tender-hearted, like a whiff of the foaming ocean spray, quite out of the hackneyed round, and yet sufficiently realistic to impress the reader with a conviction that it is the record of a life which has been lived, which, if not the highest aim of the novelist's art, is yet an indispensable adjunct to it. We have only to add that Shetland is now easily reached by regular steamers plying between Granton (Edinburgh) and Lerwick, the capital of the islands; while we believe a small steamer plies from Lerwick for local accommodation. A summer cruise in a yacht would, however, be the perfection of voyaging for the purpose not only of seeing Shetland, but Orkney and various intermediate islands, such as Fair Isle and Foula, which are out of the way of general traffic. To visit these distant fragments of land in the north, forming the scene of Scott's vivid romance of *The Pirate*, would furnish a new sensation never to be forgotten.

THE MONTH:

SCIENCE AND ARTS.

THE Report of the meeting of the British Association held last year at Glasgow has just been published in a goodly volume of more than three hundred pages. Among its contents are Reports of Committees, of which it may be said that the more widely they are known the better; and bearing in mind recent disasters at sea, the Investigation of the Steering Qualities of Ships by Professor Osborne Reynolds of Owens College, Manchester, appears the more interesting. 'The experiments of the Committee on large ships,' he remarks, 'have completely established the fact, that the reversing of the screw of a vessel with full way on, very much diminishes her steering power, and reverses what little it leaves; so that where a collision is imminent, to reverse the screw and use the rudder as if the ship would answer to it in the usual manner, is a certain way of bringing about the collision.' This is an important

fact, for it is well known that collisions have been occasioned by the very means made use of to avoid them. And Professor Reynolds says further: 'It appears that a ship will turn faster, and for an angle of thirty degrees, in less room when driving full speed ahead, than with her engines reversed, even if the rudder is rightly used. Thus when an obstacle is too near to admit of stopping the ship, then the only chance is to keep the engines on full speed ahead, and so give the rudder an opportunity of doing its work. These general laws are of the greatest importance, but they apply in different degrees to different ships; and each commander should determine for himself how his ship will behave. . . It is also highly important that the effect of the reversal of the screw should be generally recognised, particularly in the law courts; for in the present state of opinion on the subject, there can be no doubt that judgment would go against any commander who had steamed on ahead, knowing that by so doing he had the best chance of avoiding a collision.'

The statements thus set forth are illustrated by diagrams which shew the position of the vessel after reversal of the screw, and the position after steaming ahead. The latter shews that collision would be entirely avoided.

We frequently read that in future sea-fights the ram will be relied on for running down enemy's ships and sending them to the bottom. But where is the captain at the present day who has had experience of ramming, and of other evolutions which will be required in a fleet of steam iron-clads under quite new conditions? Soldiers can go into temporary camps and get experience in 'autumn manœuvres'; but sailors cannot have mock-actions and run down ships which cost half a million sterling, nor venture to try the eighty-ton-gun on their consorts. Hence there will be very much to learn in the first great naval battle.

Under these circumstances, Professor Reynolds recommends that small steam-launches should be built of wood, each representing the exact form of one of our large ships, and that with these all possible manœuvres should be carried out, and officers make themselves familiar with all the effects of the screw on the rudder, with all the conditions of steering, with all the evolutions requisite to bring about or to avoid a collision, and with the effects of ramming. If strongly built of wood, these little vessels would withstand an experimental blow from the ram.

The value of such experiments would be real, for it is now known that the behaviour of a small copy of a ship is exactly the same as that of the great ship, in proportion to the size. The waves set up by the launch bear the same relation to her size as the waves of the ship do to the ship. The recognition of this law marks an epoch in the progress of naval architecture. Given a model, Mr Froude 'can now predict with certainty the comparative and actual resistance of ships before they are constructed.'

The Report of the Committee for investigating the circulation of the underground waters in the New Red Sandstone and Permian formations of England, and the quantity and character of the water supplied to various towns and districts from these formations, conveys information interesting to everybody—for everybody drinks. At Liver-

pool there are wells sunk in the New Red Sandstone which yield more than seven million gallons daily; at Birkenhead the same; at Coventry, Birmingham, and Leamington four millions and a half; at Nottingham nearly four millions; and at Warrington and Stockport more than a million and a half gallons every day. The total makes up a large quantity; but it is nothing in comparison with the supply which the whole area of the New Red may be expected to furnish. This area, says the Report, is certainly not less than ten thousand square miles in extent in England and Wales, with an average rainfall of thirty inches, of which certainly never less than ten inches per annum percolates the ground, which would give an absorption of water amounting to no less than one hundred and forty-three millions three hundred and thirty-six thousand gallons per square mile per annum; which, on an available area of ten thousand square miles, gives an annual absorption of nearly a billion and a half of gallons in England and Wales. As if to heighten the effect of this good news, we are told the 'New Red Sandstone Rock constitutes one of the most effective filtering media known. . . . It exerts a powerful oxidising influence on the dissolved organic matter, which percolates it to such an extent, that in the waters of certain deep wells, every trace of organic matters is converted into innocuous mineral compounds.' And again: 'Waters drawn from deep wells in the New Red Sandstone are almost invariably clear, sparkling, and palatable, and are among the best and most wholesome waters for domestic supply in Great Britain.' After reading this, may we not say that Undermere, about which no one will quarrel, is the lake whence great towns in the north should draw their water supply?

During the meeting of the British Association at Plymouth last August, the Mineralogical Society held their second annual gathering under the presidency of Mr Sorby, F.R.S., who in his address gave an account of a new method for determining the index of refraction of minerals, which can be readily employed in their identification. This seems a dry subject; but it is one likely to be valuable and interesting to mineralogists and chemists, and to lead to an entirely new branch of mineralogical study, and to the discovery of a new class of optical properties of crystals. For a proper understanding of the method, a knowledge of optics, of mathematics, and other branches of science would be necessary; but we may state generally that it is based on the fact, that if an object, when placed in focus for examination on the stage of a microscope, is covered with a plate of some highly refracting substance, the focal length is increased; in other words, the microscope must be raised a little farther from the object in order to restore the focus. The distance to which the microscope has been moved thus becomes a measure, which can be accurately determined on a scale to thousandths of an inch. By this measure, therefore, very minute differences of refraction can be determined, and the several minerals identified; and Mr Sorby, in conjunction with Professor Stokes, Sec. R.S., has arrived at certain definite conclusions, which, embodied in numerical tables, may ere long be consulted by all interested in the subject.

On this point Mr Sorby explained in his address: 'On applying this method to the study of various

minerals, the difference is found to be very great. We can mostly at once see whether they give a single unifocal image or one or two bifocal images, and form a very good opinion respecting the intensity of the double refraction, and easily determine whether it is positive or negative. . . . These facts combined furnish data so characteristic of the individual minerals, that it would usually be difficult to find two approximately similar. . . . It has been said that in studying the microscopical structure of rocks it is often difficult to distinguish nepheline from apatite. But the index of nepheline is about 1.53, whereas that of apatite is 1.64, and such a considerable difference could easily be recognised in a section not less than one-fiftieth of an inch in thickness.

The observations hitherto made prove that minerals may be ranged in classes according to their refracting power and their chemical composition. The fluorides are lowest in the scale, while quartz, corundum, the sulphides and arsenides, are among the highest. From these particulars it will be understood that researches into mineralogy have a prospect of becoming more and more interesting.

As we have a British Association for the Advancement of Science, so our neighbours across the Channel have a French Association. It met last August at Havre, and in a few of its fifteen sections manifested signs of activity. Among the meteorologists, diagrams were exhibited shewing clearly that the 'changes of pressure in the upper regions of the atmosphere are by no means similar to those at the surface of the earth; for when the pressure at the lower station decreases, it rises at the upper station, and the reverse; or when it is steady at the one, it rises or falls at the other.' A line of telegraph for meteorological purposes is now erected from Bagnères to the Pic du Midi, seventeen miles. The Pic is nine thousand feet high, and will be an interesting observing station, in constant communication with the lower regions. A proposition was made that the Transatlantic steam-ship companies should be requested to institute regular meteorological observations on board their vessels; and that the captive balloon of next year's Great Exhibition at Paris should be an observing station. Paris is chosen as the meeting-place of the Association for next year, and at the same time a free international meteorological congress will be held.

During recent years it has been said that the marshes and saltish depressions in the territory of Algiers and other parts of North Africa were once covered by the sea, and schemes have been announced for readmitting the sea by cutting channels from the Mediterranean. Mr Le Châtelier, a French chemist, says—the existence of the salts is not due to the drying up of a former sea, but to the masses of rock-salt which exist in the mountains. From these the salt is dissolved out by rain or by subterranean waters, and the saline solution percolates the soil to feed the artesian reservoirs which underlie the desert. These observations will require attention from geographers.

If any apology were required for a somewhat late notice of Dr Sayre's method of rectifying curvature of the spine, it would be found in the fact that among the arts the healing art holds an eminent place, and has special claims on every one's attention. Dr Sayre, an American, has this

year visited England to make known his method of curing those malformations of the backbone under which many persons remain cripples for the whole of their life; and now that it is known, the wonder is that it was not thought of before. In carrying out the operation, the patient is lifted from the ground, and suspended by a support under the chin and back of the head: sometimes a support is placed under the armpits, and sometimes the arms are raised. In this position the weight of the pelvis acts on the crook in the spine, and pulls it straight; a bandage dipped in plaster of Paris is then bound round the body; a few iron splints are inserted in the bandage, and as the plaster dries, a mould is formed, which keeps the straightened bones in place. The suspension is now at an end; the patient is found to be an inch or two inches taller than before the operation, and can walk without limping. After a few days, the plaster-mould is cut up each side, to allow of removal for washing the body; but the two halves are quickly replaced and held in position by a bandage. In some instances six months' wearing of the plaster-mould effects a cure, and the patient enjoys an ease and activity never before experienced.

This method of cure contrasts favourably with the treatment which keeps the patient supine many weary months. As may be imagined, it succeeds better with children than with adults; but even adults have been cured. A case occurred at Cork, the patient being a woman aged twenty-two, and requiring a little mechanical pulling to assist in the straightening; but it was accomplished, and she walked out of the room two inches taller than she entered it.

Mr Hoppe-Seyler, a learned German, has published a paper on Differences of Chemical Structure and of Digestion among Animals, supported by numerous examples, which shew that according to the organism so is the power to form differences of tissue; and he sums up thus: 'Looking at the question broadly, we find that the chemical composition of the tissues and the chemical functions of the organs present undoubted relations to the stages of development, which shew themselves in the zoological system, as well as in the early stages of development of each individual higher organism. These relations deserve further notice and investigation, and are qualified in many respects to prevent and correct errors in the classification of animals. It is generally supposed that the study of development is a purely morphological science, but it also presents a large field for chemical research.' This concluding sentence is significant, and should have serious consideration.

Waste pyrites from the manufacture of sulphuric acid is, as regards hardness, a good material for roads when mixed with gravel; but chemically it is not good. In the neighbourhood of Nienburg, Hanover, where roads and paths were covered with waste pyrites, it was found that grass and corn ceased to grow; and a farmer on mixing well-water with warm milk, observed that the milk curdled. The explanation is, that the waste pyrites 'contained not only sulphide of iron and earthy constituents, but also sulphide of zinc, and that by the influence of the oxygen of the atmosphere and the presence of water, these sulphides were gradually converted into the corresponding sulphates;' and these, continually extracted by the

rain-water, soaked into the soil, contaminated the wells, and produced other injurious effects.

The want of really efficient names to distinguish various kinds of manufactured iron has long been felt in the iron trade. The Philadelphia Exhibition gave rise to a Commission which, after discussion of the question, have recommended that all malleable compounds of iron similar to the substance called wrought-iron shall be called 'weld-iron;' that compounds similar to the product hitherto known as puddled steel, shall be called 'weld-steel;' that compounds which cannot be appreciably hardened when placed in water while red-hot shall be called 'ingot-iron;' and that compounds of this latter which from any cause are capable of being tempered, shall be called 'ingot-steel.'

By further exercise of his inventive abilities, Major Moncrieff has produced a hydro-pneumatic spring gun-carriage perfectly adapted for use in the field. A gun mounted on this carriage could be made ready for action within ten minutes after its arrival in the trenches.

The Science and Art Department have commenced the publication of a 'Universal Art Inventory, consisting of brief Notes of Fine and Ornamental Art executed before the year 1800 chiefly to be found in Europe.' This is a praiseworthy undertaking, for there are so many rarities of art which can never be seen by the multitude, which can never be moved from their place or purchased, that an inventory thereof with descriptive notes cannot fail to be of great utility. Nearly all the governments of Europe and many royal personages are co-operating in this work, which includes reproductions in possible instances. Some of these reproductions are well known to the frequenters of the South Kensington Museum; for example, the great mantel-piece from the Palais de Justice at Bruges; Trajan's Column from Rome; a Buddhist gateway from India, of the first century; a monument from Nuremberg, and other elaborate works. As a means of reference, this Inventory will be welcome to many a student, and as it necessarily will take many years to complete, there will be the pleasure of watching for fresh instalments of information. But all students should remember that 'the laws of design are as definite as those of language, with much the same questions as to order, relationship, construction or elegance; differing for dissimilar styles as for divers tongues. The pupil in design has similar obstacles to encounter with those of the schoolboy in his alphabet and grammar; the ability to use the pencil or the brush will no more produce an artist than the acquirement of the writing-master's art with Lindley Murray's rules will make a poet.'

Professor Justin Winsor, one of the American delegates to the conference of librarians held last month, points out with much earnestness that by the extension of libraries a great impetus may be given to national education, and an opening made at the same time for the employment of women. In America, pains have been taken to engage men and women in the work who are content to labour to attain the level of a far higher standard than the public at large have been usually willing to allow as the test of efficiency. 'We believe,' remarks the Professor, 'that libraries are in the highest sense public charities; that they are missionary enterprises; that it is to be supine if

we are simply willing to let them do their unassisted work; that it is their business to see two books read instead of one, and good books instead of bad. To this end it has been urged that one of our principal universities shall have a course of bibliography and training in library economy.'

In reply to various correspondents, we beg to state that the information regarding the manufacture of vegetable isinglass in Rouen, which appeared under the head of *A Few French Notes* in No. 717 of this *Journal*, was taken from *L'Armée Scientifique*, a work compiled by the well-known French savant, M. L. Figuier. As there seems to be some difficulty in reconciling M. Figuier's statements with the present state of the process as carried on in France, we are making further inquiry, and hope to be able to give early and definite information.

A FEARFUL SWING.

THE 'Shaftmen' at our collieries are selected for their physical strength and pluck, in addition to the skill and practical knowledge required for their particular work. The incident we are about to relate will shew how severely the former of these qualifications may at times be tested.

The work of these men is confined to the shaft of the pit, and consists mainly in repairing the 'tubbing' or lining of the shaft, stopping leaks, or removing any obstructions interfering with the free passage of the cages up and down the pit. The coal-pit at N— has a double shaft, divided by a 'bratticing' or wooden partition. These divisions we will call A and B. Two cages (the vehicles of transport up and down the pit) ascend and descend alternately in shaft A. At a certain point the shaft is widened, to allow the cages to pass each other, and their simultaneous arrival at this point is insured by the arrangement of the wire-ropes on the winding-wheels over the pit-mouth. The oscillation of the cages is guarded against by wooden guiders running down each side of the shaft, which fit into grooves in the sides of the cage.

On one occasion during a very severe frost these guiders had become coated with ice, and thus their free passage in the grooves of the cages was interfered with. Before this obstruction was discovered, the engine having been set in motion, the downward cage, which fortunately was empty at the time, stuck fast in the shaft before arriving at the passing-point. The ascending cage, whose only occupant was a small boy returning to 'bank,' proceeding on its upward course, crashed into the downward cage in the narrow part of the shaft, where of course there was only a single passage. Though the shock was something terrific, the steel rope was not broken; as the engineman, whose responsible position entails the greatest presence of mind and watchfulness, had stopped the engine on the first indication of an unusual tremor in the rope. Yet such was the violence of the meeting, that both cages, though strongly 'constructed of iron, were bent and broken—in fact rendered useless—by being thus jammed together in a narrow space. The greatest anxiety was felt as to the fate of the boy, as it was seen that even if he had escaped with his life after such a severe crash, his rescue would be a work of great danger and difficulty. . .

We may imagine the horror of the poor little fellow while suspended in the shattered cage over a gulf some four hundred feet deep, both cages firmly wedged in the shaft, and the ropes rendered useless for any means of descent to the scene of the catastrophe. The readiest way of approach seemed to be by shaft B, the position of which we have indicated above. Down this then, a Shaftman, whom we will call Johnson, descended in a cage until he arrived at an opening in the brattice-work by which he could enter shaft A. He found himself (as he supposed) at a point a little above where the accident had occurred; and this conclusion he came to from seeing two ropes leading downwards, which he naturally took to be those by which the cages were suspended. Under this impression he formed the design of sliding down one of the ropes, with a view to liberating, if possible, the entangled cages and securing the safety of the unfortunate boy. The hardy fellow was soon gliding through the darkness on his brave and dangerous errand. He had descended about forty feet, when, to his horror and amazement, his course was suddenly checked by a bend in the rope; and the terrible discovery flashed upon him, that he was *suspended in the loop of the slack rope*, which here took a return course to the top of the downward cage!

It will be understood that when the descending cage stuck upon the runners, as the rope continued to unwind from the pulley it hung down in a loop, descending lower and lower, until the engine was stopped by the meeting of the cages. This loop or 'bight' was naturally mistaken by Johnson for the *two ropes*, and he did not discover until he found himself in the fearful situation described, that he had entered through the brattice into shaft A *below* instead of above where the cages were fixed. There he hung then, over a yawning abyss many fathoms deep—closed from above by the locked cages—all below looming dark and horrible.

None of course knew his danger; his hands were chilled by the freezing rope; his arms, already fully exercised, began to ache and stiffen with the strain and intense cold, added to the bewildering sense of hopeless peril. Good need there was then that pluck and endurance be found in the Shaftman! His square sturdy frame and unflinching spirit were now on their trial. Had his presence of mind gone or his nerve failed, he must have been paralysed with fear, lost his hold, and been dashed into an unrecognisable mass.

But self-preservation is a potent law, and working in such a spirit he framed a desperate plan for a struggle for life. The guiders running down the inside of the shaft are fastened on to cross-beams about six feet apart. Johnson hoped that if he could reach one of these, he might obtain a footing whereon to rest, and by their means clamber up to the opening in the brattice-work. How to reach them was the next question that flashed lightning-like through his brain. This he essayed to do by causing the rope to oscillate from side to side, hoping thus to bring himself within reach of one of the cross-beams. And now commenced a *fearful swing*. Gaining a lodgment with one knee in the loop, he set the rope swinging by the motion of his body, grasping out wildly with one hand each time he approached the side of the shaft. Once, twice, thrice! he felt the cold icy face of the 'tubbing,' but as yet nothing except

slimy boards met his grasp, affording no more hold than the glassy side of an iceberg. At last he touched a cross-beam, to which his iron muscles, now fully roused to their work, held on like a vice. He soon found footing on the beam below, and then letting go the treacherous rope, rested in comparative security before beginning the perilous ascent. With incredible endurance of nerve and muscle he clambered upward alongside the guider, by the aid of the cross-beams, and by thrusting his hands through the crevices of the timber. In this manner he reached the opening into shaft B, where the cage in which he had descended was waiting. Chilled, cramped, and frozen, and barely able to give the signal, he was drawn to the pit-mouth prostrate and exhausted. The boy was rescued unhurt by a man being lowered to the top of the cages in shaft A. Johnson suffered no ill consequences, and though a hero above many known to fame, he still pursues his hardy task as a Shaftman; while beneath the homely exterior still lives the pluck and sinew of iron that did not fail him even in his Fearful Swing.

TO MY ROBIN REDBREAST.

The following lines are taken from *The Captive Chief, a Tale of Flodden Field*, by James Thomson (H. H. Blair, Alnwick, 1871).

Now keenly blows the northern blast;
Like winter hail the leaves fall fast,
And my pet Robin's come at last
To our old thorn;
With warbling throat and eye upcast
He greets the morn;

Like some true friend you come to cheer,
When all around is dark and drear.
And oh! what friend to me more dear
Than your sweet sel' ?
Your mellow voice falls on my ear
Like some sweet spell.

Oft at the gloaming's pensive hour,
When clouds above me darkly lower,
I've sought a seat in some lone bower,
With heart oppress;
You soothed me with your magic power,
And calmed my breast.

When Morning dons her sober gray
To usher in the coming day,
And Phœbus shines with sickly ray
On all around,
No warblers greet him from the spray
With joyous sound.

But you, sweet bird, unlike the throng,
Salute him with a joyous song.
When heavy rains and sleet prolong
The dreary day,
You chant to him your evening song
Upon the spray.

No blackbird whistles in the grove,
Where late in chorus sweet they strove;
No warbler's tongue is heard to move,
But all is sad;
No cushat woos his amorous love
In hazel glade.

PRICE 1½d.

COSTERS AND THEIR DONKEYS.

IN walking through any part of the metropolis—be it in the City, the West End, or any part of the suburbs north or south—you will, especially if early in the day, see men with wheeled trucks drawn by donkeys, and laden with fish, vegetables, or other articles for sale to the inhabitants. Rough as they are in appearance, and poor as may be their commercial outset, these are a useful class of persons; and looking to the vastness of the population crowded within a wide but yet limited space, one has a difficulty in knowing how the ordinary life of many individuals could get on without them. A small town could manage pretty well with a few shops. But in the metropolis, in which there are now from three to four millions of people, the shop-system does not fulfil the general wants; and supernumeraries with trucks to hawk their wares among customers, have sprung up as a convenience and necessity. The name given to these humble street-traders is Costers or Costermongers. Their professional designation is of old date, and is traced to Costard, a large variety of apple. Costermongers were therefore originally street-sellers of apples. The apple might be termed their cognisance.

Henry Mayhew, in that laboriously constructed and vastly amusing work of his, *London Labour and London Poor*, issued some six-and-twenty years ago, describes the costermongers as numbering upwards of thirty thousand. It might be inferred that in the progress of time, the number would have increased; but such, we believe, is not the case. Social arrangements have considerably altered. Owing to police regulations, there is a greater difficulty in finding standing-room in the street for barrows. By improved market arrangements and means of transport, small shopkeepers in humble neighbourhoods have become rivals to the costers. As regards means of transport for traders of all sorts, there has been immense progress within the last few years, on account of the abolition of taxes on spring-carts, and latterly

the abolition of taxes on horses. We might say that for these reasons alone there are in all large towns ten times more spring-carts and vans for distribution of goods from shops than there were a very few years ago. Of course, all this has limited the traffic of itinerant vendors, and prevented any great increase in their number. Under such drawbacks, however, there are probably still as many as thirty thousand costermongers in and about the metropolis. The young and more rudimental of the class do not get the length of possessing donkeys. They begin with hand-trucks, which they industriously tug away at, until by an improvement in circumstances they can purchase, and start a donkey. Having attained the distinction of driving instead of personally hauling, they have enviedly reached the aristocracy of the profession. They are full-blown costers, and can set up their face in all popular assemblages of the fraternity. A costermonger driving his donkey and habitually taking orders for carrots or turnips as he passes the doors of anticipated customers, is in his way a great man. At all events he presents a spectacle of honest labour, and is immensely more to be respected than the pompous 'swell' who sponges on relations, who is somewhat of a torturation, and who never from the day of his birth did a good hand's turn.

Mayhew, who deserves to be called the historian of London street-dealers of all descriptions, gives a far from pleasing picture of the social condition and habits of the costermongers. With all their industry, they are spoken of as for the most part leading a dismally reckless kind of life—spending their spare hours at 'penny gaffs,' a low species of dancing saloons, and so on. What he mentions is just what might be expected in a loose, uneducated, and generally neglected population of a great city. If you allow people to grow up very much like the lower animals, what are you to expect in the way of delicacy? You may be thankful that with the innumerable disadvantages of their condition, and the temptations that surround them, they have the rough good sense to

work for their livelihood, however vagabondising may be their enterprise.

The lapse of thirty years has made a considerable change for the better in the social economics of the costermongers. They have participated in, and been benefited by, those elevating influences which have been assiduously cultivated by city missionaries, by the press, and other agencies. Penny gaffs have almost disappeared. The licenses compulsorily required for singing, music, dancing, and dramatic rooms may be said to have killed them. The costers with advanced tastes and intelligence seek for more rational recreations than were customary in the past generation. Attached to home life, marriages amongst them are more numerous; they pay greater attention to their children; they read more and drink less; notably they are better dressed and kinder to their donkeys. On this last particular we would specially dwell. A consideration for the comforts of the animals dependent on our bounty marks an advance in civilisation. The character of a man may indeed be known from the manner in which he treats his horse, his dog, his ass, or any other creature of which he is the owner. Rude treatment to any of these dumb and defenceless beings who willingly minister to our profit or pleasure, indicates a low type of humanity. The London coster used to be careless about his donkey. As concerns its food, its style of harness, its stabling, and its hours of work, there was no particular attention. Such, generally speaking, is no longer the case. We might say that the rights and feelings of the animal are respected. So to speak, it is better dressed, and is more lively in its aspect. In its face there seems to be a spirit of contentment. The coster, its master, pats it, and addresses it in a far more encouraging and kindly way than was customary in our early days, or even so lately as twenty years ago.

All this is as it should be. Has it ever occurred to any one to inquire why the donkey should have so long been held in contempt and been cruelly tyrannised over? In the East, and in the south of Europe, the ass is esteemed as a useful beast of burden. Alpine regions inaccessible to wheel-carriages, would not be habitable without the services of this sure-footed and easily-kept animal. It is the only carrier, and may be seen patiently toiling with laden panniers on narrow pathways far up in the mountains. In our own country, as an aid in various laborious occupations, the donkey has never been properly appreciated, but on the contrary, it has met with such shameful usage as to stunt it in its growth and sorely to try its naturally gentle temper. Reasons could perhaps be assigned for this undeserved contumely. The poor donkey has no great claim to elegance of form. Its long ears are a reproach; no one being apparently aware that Nature has bountifully granted these long trumpet-shaped ears to enable it to hear at a great distance, and if necessary to escape from its enemies. Another reason is, that

the donkey is too patient and meek to resent affronts. Its submissiveness is imputed to stupidity. If it could stand up for its rights, it would be more thought of. The lion, which is of no use whatever, and is nothing else than a ferocious wild beast, with a proud overbearing look, is highly honoured as an emblem of power and dignity. The ass is heraldically valueless. It could be adopted only as an emblem of untiring and uncomplaining labour, which would suit no coat armorial. In the improved treatment of the costermonger's donkey we begin to see brighter days for this hitherto down-trodden creature. The costers themselves being improved through different agencies, their animals feel the benefit of the general advance.

In the vast obscurities of London there is a neighbourhood known as Golden Lane and Whitecross Street, intimately associated with the progressive improvement of costers and their donkeys. A kind of oasis in the desert, this neighbourhood, which is now considerably improved in appearance, shines forth as an important central mission, to the merits of which we can but feebly do justice. We have often had occasion to remark how much good is unostentatiously done by one man, through mere force of character and persevering vigilance. The one man in this case has been Mr W. J. Orsman, who for a series of years has earnestly devoted himself to the amelioration of the condition, moral and social, of the poor street-dealers clustered in and around Golden Lane and Whitecross Street. He acts as honorary secretary to the Costermongers' Society; he edits a little periodical, known as the *Golden Lane Mission Magazine*; and he fosters and helps to maintain many small sub-societies, if we may so term them. Among these are a 'Share Barrow Club,' for lending barrows to men who possess neither donkey-carts nor hand-barrows; a Sick and Burial Club, to which the men pay fourpence a week each; a 'Coster's Friends' of Labour Club, through the aid of which the men can put out small sums at interest, or borrow small sums for limited periods; an 'Emily Loan Club' (named, we believe, after a daughter of the Earl of Shaftesbury), for the benefit of respectable female street-dealers; a Penny Savings-bank; a Maternity Fund; a Soup Kitchen; a Coal Fund; a Clothing Club; a Donkey Club (for purchasing donkeys by means of small instalments), besides others for educational, moral, and religious improvement.

The accounts given of the annual meetings of the costers and their friends are among the curiosities of current literature. Coming prominently forward at these assemblages we perceive the Earl of Shaftesbury, a nobleman who, animated by the kindest motives, deems it no sacrifice to his high position to encourage by his presence and by his speeches the humble efforts made by the costers in the progress of well-doing. A few years since, at one of the annual meetings, which are held in May, the Earl of Shaftesbury took the chair. First, there was tea given to three hundred of the men; then was held a donkey-show, in which the excellent condition of the animals was fully evinced; and then came the event of the evening. The costermongers had bought a donkey of unusual size, strength, and beauty; they decked him profusely with ribbons, and brought him into the Hall. In the names of

all the men, Mr Carter, a vestryman of St Luke's parish, who kindly interests himself in their welfare, presented the donkey to the Earl of Shaftesbury. The Earl, as is said, had already become, in a whimsical and pleasant sense, a costermonger, and now in virtue of his donkey was an accepted full member of the corps. Whether the Earl's Neddy appreciated the honour conferred on him, we do not know; but we may be quite sure that no hard usage was in store for him.

As may be generally known, attempts to encourage the improvement of donkeys have taken place through public shows and the offering of prizes. A Donkey and Mule show, held at the Crystal Palace in May 1874, was the means of giving to many persons their first idea of the real value of an exhibition which some had beforehand laughed at, as an absurdity. It was amply proved that the donkey can become a really beautiful animal when well treated; and it was equally made manifest that rough street-dealers can be as kind as their betters when encouraged to be so. An archbishop carried off a prize; several costermongers did the same; and a truly cosmopolitan feeling was exhibited when the prizes were distributed. The Earl of Shaftesbury, who presided on the occasion, humorously claimed to be a costermonger himself; for (to encourage others in a good work) he had enrolled his name in the Golden Lane branch of the Costermongers' Society. Many of the donkeys exhibited at the Crystal Palace had been employed in drawing carts and trucks laden with vegetables, fruit, fish, salt, sand, firewood, crockery-ware, and other commodities; and the excellent condition of some of them won prizes for their owners. Even a few of the donkey-drivers of Blackheath and Hampstead Heath showed that the fraternity are not always so rough and unkind as they usually appear. It was asserted that donkeys which do not work on Sunday are generally more active and ready on Monday; so that the trader is but little a loser by this course in the long-run. The Earl of Shaftesbury remarked that: 'It would be seen from the show that these animals are designed by Providence to be of the greatest service to mankind; and that kindly treatment and respect—respect for the wants and feelings of the animals—will bring their own reward in willing service.' Several donkey-shows have since been held in and near the metropolis, conveying the same useful lesson.

In August of the present year, a Pony and Donkey show was held in London, in connection with the Golden Lane Mission and Society. The Earl of Shaftesbury and Lady Edith Ashley kindly and patiently examined the hard-working dumb companions of the costermongers, and exchanged pleasant words with the men. There was a tea for four hundred going on nearly at the same time. After this came a general 'march past,' and a distribution of money and books as prizes. The donkeys were all in admirable condition; while many of the ponies were plump and sleek. His lordship now called for Wilkins, a shrewd prosperous coster of Golden Lane, and bedecked with the insignia of authority as an officer of the Benefit Society. This coster and another made brief speeches; after which Colonel Henderson, Chief Commissioner of the Metropolitan Police, declared that the costers are generally deserving of high

praise, and that the police have very little trouble with them—when once the laws relating to the public streets are well understood. After a few more speeches and addresses, the noble chairman said in pleasant humour, that he had received a poem entitled *The Earl and the Ass*; that the donkey he had received a few years before at the hands of the costermongers was under the doctor's care; and that this fact alone prevented the animal from being present. Every donkey at the show was known by some name or other; and hence there were many such designations as Tommy, Old Tommy, Black Tommy, Jack, Prince, Paddy, Old Jack, Old Sam, Boko, Charlie, Mike, Ugly Tom, Quick; while the other sex in the race was represented by such feminine names as Jenny, Pretty Polly, Kitty, Pretty Jane, Maggie, and Betsy.

We do not know what was the poem to which the Earl of Shaftesbury alluded, but conclude that it was a poem which appeared in *Punch* relative to the presentation of the donkey to his Lordship. To shew how a facetious periodical can rise above mere jesting, we transcribe the following verses:

Could there be a better gift? The patient beast
Who bears the stick, and will on thistles feast,
Yet in hard duty struggles to the end,
Is always grateful to a human friend,
But seldom finds such friends; is roughly fostered
By costermongers, sellers of the costard,
Sellers of other things from door to door,
And very useful traders for the poor—

He bears a cross, we know; and legends say
Has borne, in memory of a wondrous day,
When love wrought miracles, in stress and strife,
And sick were healed, and dead men raised to life.
Since when, 'twixt hard knocks, hard words, and
hard fare,
He and his owners both their cross must bear.

The Earl, who loves his race, loves other races;
He has sought evil out in darksome places,
And bravely grappled with its many arms,
And tamed its strength, and paralysed its harms;
Brought aid to weakness, moved dead weights
away,
That crushed the soul down, deep in mire and clay.
The greatest, by descending, may ascend:
The peer who is the costermongers' friend,
Dares on the platform stroke an ass's ears,
Rises above the level of his peers.

As an evidence that the endeavours to improve the London costermongers morally as well as physically, have not been thrown away, we may add the following anecdotes.

In 1872 a costermonger named Darby, plying his itinerant trade in the densely packed and comfortless region immediately eastward of the City of London, was one day driving his donkey-cart, laden with cheap fish from Billingsgate. The poor donkey accidentally put his foot into a plug-hole, fell, and broke his leg between the knee and the fetlock—pitching his master out of the cart, and seriously bruising him. His brother-costers advised Darby to kill the animal at once, as no one had ever heard of a donkey's broken leg being healed. But Darby would not listen to this. He took the donkey home, and made a temporary bed for him in the only sitting-room. The man and his wife tended the poor animal, which often groaned with

pain. The wife was a washerwoman at the East London Hospital, but she did not grudge to the poor donkey a little of that time, which was so valuable to her. A kind lady then undertook to take charge of the donkey until cured, at a place twelve or fourteen miles from London. With bandaging and careful treatment, aided by the benefit of pure fresh air, the leg became sound in eighteen months; and Darby had a good reply to make to those companions who had said to him: 'Kill it, old fellow; it will never be able to get up again. First loss is the best; nobody can set a donkey's leg. Kill it, old fellow, at once!' The kind-hearted costermonger became known as 'Darby, the donkey's friend.' A testimonial was presented to him by the Ladies' Committee of the Society for the Prevention of Cruelty to Animals; and he is justly proud of it.

As we write, a paragraph appears in *The Times*, communicated by an observer. 'Having occasion to pass through Whitecross Street on Thursday evening, my attention was attracted to some fine turnips on a coster's barrow. Retaining my boyish fondness for a raw turnip, I at once selected one, and putting my hand into my pocket, paid, as I thought, two halfpence, the price charged. I had scarcely advanced a hundred yards, when a tap on my shoulder caused me to halt; and lo! the woman from whom I had made my last purchase accosted me. "What did you give me?" she said. I told her as above, when she opened her hand and displayed two bright shillings, which I had given her by mistake, and which she now returned. Thanking the woman for her honesty, I rectified the matter, reflecting on my way home that the labours of Lord Shaftesbury and his worthy coadjutors among the costermongers could not have been spent in vain; for the cleanliness, civility, and "honour bright" of these small traders are very evident to those who knew the locality ten years ago.'

Our task is ended. We have told all we know about the costermongers, and no doubt much that we have said is not new to many of our readers; but in the way we put it, good may be effected, as shewing the degree of social progress in an industrious and useful class in the metropolis. Donkeys can of course never attain to the beauty, the strength, and the value of the horse. We may admit their inferiority to ponies; but as docile, kept at little expense, and useful in various departments of labour, they have their appointed place in creation. They offer themselves as the poor man's friend and servant. In what numberless cases, as is exemplified by the London costers, might they be employed to meliorate a lot sometimes very hard to bear! We do not bespeak for them more consideration than they deserve. All we expect is that they shall not be treated as abject and worthless. Let us appreciate their unobtrusive willingness to serve to the best of their ability. They ask little, and let that little be conceded. We do not look for elegant turn-outs of donkeys, though we believe the example of a donkey-phaeton has been set by the Baroness Burdett-Coutts, who is never wanting where the welfare of the lower animals is concerned. From our own personal experience, we may tell of employing Donald, our pet donkey, to draw a light four-wheeled phaeton, holding two persons. In bright harness, enlivened with jing-

ling bells, he proceeds on a drive of eight to ten miles with the speed of a quick-trotting pony, and with a cheerfulness which it does one good to look at.

W. C.

A CAST OF THE NET.

THE STORY OF A DETECTIVE OFFICER.

IN FOUR CHAPTERS.—CHAPTER I.

ANY one who feels the slightest curiosity as to the date of my story, can tell pretty nearly when its events occurred, by various incidents mentioned in it, and which the public know quite as much about as I do; but I do not feel inclined, for certain reasons of my own, to identify the precise date or to name the exact spot at which I was employed in the business.

It was a case for the police—for the detective police—and I was the detective employed. Now you must understand that I was not at this time regarded as a regular detective; I was a sergeant in what we will call the 'A' division, and I did ordinary duty; but though I was not yet on the regular detective staff, somehow or another I was very often taken from my usual work and put on all sorts of jobs, sometimes fifty or a hundred miles in the country; and I was once paid a very high compliment by the chief magistrate—of course I mean at Bow Street. He said: 'Nickham, you're not a regular detective, are you?'

'No, your Worship,' I said; 'I am not.'

'Well, Nickham, you're worth a dozen of them; and I have made a special note of your conduct, and shall send it on to the Commissioner.'

The Commissioner was old Sir Richard Mayne then. And that's how I got to be a sergeant; but it was only because I was lucky in two or three cases which the chief magistrate happened to notice.

Well, I was one night at the section-house, for I wasn't on duty (I don't mean the station-house; the section-house is a place where our men lodge, perhaps fifteen or twenty together, or more); and I was sitting in the large room by myself; for it was a fine evening, and none of the men cared much about chess or draughts or things of that kind. I was reading the paper by myself, when the door opened and one of our people looked in. It was Inspector Maffery; and I was very much surprised to see him there, as our place was quite out of his district. Seeing I was by myself, he said: 'Oh!' in a tone which shewed he was pleased at it, and turning to some one outside, he said: 'Come in, sir; the party is here by himself.' With this, a tall, stout, gray-whiskered gentleman came in.

Inspector Maffery closed the door after him, and not only did that, but shot the bolt, and then coming to me at the table, says: 'Nickham, this is Mr Byrle, the celebrated engineer that you have heard of.'

Of course I had heard of him; in fact I once had a cousin who worked in his factory. So I bowed and made a civil remark.

Then Inspector Maffery went on to say: 'This, Mr Byrle, is Sergeant Nickham, one of our most active men, as I have told you, and who, I think, is just the man for you. This place is very safe; and as I have bolted the door, and the men below know I am here, there will be no interruption; and you can say anything you wish to Nickham as well here as anywhere.'

So they sat down ; and with a very polite speech, for he was really a gentleman, Mr Byrle told me what he wanted.

He made a long story of it ; I shall not ; but the public have really no idea of putting facts well together, and presenting them without any excrescences, if I may say so. However, I listened patiently, and found out what was required. It seemed that his factory had been robbed on several nights, in spite of an extra watchman being put on ; and only the completely finished and most expensive engine-fittings were taken ; shewing that the thief, whoever he was, knew what things to take, where to find them, and where to dispose of them. The robberies were mortifying, because they proved, as all such things do, that the firm were employing a thief, and trusting some one who was deceiving them. The loss of these fittings often delayed other work seriously ; and above all, it was considered that it demoralised all the factory (where best part of a thousand hands were employed), by shewing that the firm *could* be robbed with impunity. So, although it was hardly the sort of business which a first-rate man was required to work ; and though I say it myself, and though spite and envy in certain quarters kept me off the regular staff, there was not a better man in London than I was, and our people knew it ; yet I listened very patiently, and asked such questions as occurred to me. For a civilian, Mr Byrle seemed pretty sharp at catching my drift ; while as an old hand, and knowing what was best with the public, Inspector Maffery sat without saying a word, or one now and again at the most, leaving Mr Byrle to settle things for himself. I then roughly sketched out a scheme, which in a few words I laid before the gentleman.

‘I understand your plan entirely, Mr Nickham,’ said the old gentleman ; ‘and the sooner you begin, the better, for I feel we shall be successful. Mr Maffery assures me you can be relieved from your duty here at any time ; so I trust there will be no delay. I have said money is not to stop you, and you will take this on account of expenses—when exhausted, let me know.’ With that he handed me a bank-note, and I thanked him, and of course promised to do my best.

Then Inspector Maffery said : ‘I will see to all the essentials, Nickham, so make your preparations as soon as you can.’

Now I liked Maffery very well, and he was certainly one of our best inspectors ; but all this civility, taking trouble off my hands and so forth, merely told me that Mr Byrle was a most liberal party, and that Maffery believed he had got hold of a good thing. Mr Byrle shook hands with me, and they went away together, leaving me to think over the business.

I must confess I was a little disappointed—although I could see I was likely to be well paid for my work—in being set at such a very commonplace job as this. After I had traced Lady Brightley’s jewels (the reader does not remember this, I daresay, as it was kept very quiet, but I got praised for my management of the case), I thought I should have been selected for the most important work ; and when Inspector Maffery brought Mr Byrle in, I really hoped it was about the great Bank-paper robbery.

The reader is quite aware, I have no doubt, that Bank of England notes are printed on paper

specially made for the purpose, and that no other paper has three rough edges, the only clean-cut edge being where the two notes have been separated—and this is one of the great tests of a genuine note. It will be recollected too, how a great quantity of this paper was stolen from the mills at Alverstoke, and the Bank was in a terrible state about it, because as for engraving and all that handicraft sort of work—why, bless me ! there’s men by the dozen in England and on the continent too—I know some of them—who could print off a note with all the little touches on which the examiners rely, as perfectly imitated as if they had worked for the Bank for years. So when the gang got hold of the genuine paper, it was a serious matter. They took the principal thief, however, and got the paper back. A desperate service it was too, as B—, the chief man in the affair, was one of the most resolute and desperate roughs in London ; and the officers that took him ran great risk, and deserved great praise.

Of course the public rejoicing was very great, because nobody had known when the bad notes might come into circulation ; but we knew, some of us, that it was all a sham, that a lot of the paper was still missing, and that if the right man got hold of it, there would soon be thousands of forged notes—all fives probably—flying about. It was pretended that all the paper was got back, or that the Bank people thought so, on purpose to make the holders of the remainder think that the hunt was given up ; but it was no such thing. Two or three of the best men in the force were to continue the search, and I had hoped I should be selected ; but I was told I would not do, because I could not speak any foreign language, and it was thought the men might have to go abroad after the paper. For all that, when I saw Inspector Maffery come in with Mr Byrle, I thought, as I just said, that I was to be chosen. However, I had found out my mistake ; and I was thinking over my instructions, when the door opened again. I did not look up at first, supposing it was one of our men ; but a cough attracting my attention, I turned round. I saw a slight-built, rather under-sized young fellow, with something of a foreign cut about him, very good-looking though, and a most uncommonly piercing eye ; and he at once said : ‘I am Mr Byrle’s clerk, and have been waiting for him, and he wishes to know where he is to see you ?’

‘To see me ?’ I said. ‘Why—does he want to see me ?’

‘I think what Mr Byrle means is, that in case he wants to speak to you, where shall he find you ?’ replied the young fellow. ‘You see I don’t know much of the business myself ; I only know he has engaged you as a detective.’

‘And that’s more than you ought to have known,’ I said ; ‘however, Mr Byrle knows his own business best. Tell him that of course he can always hear of me under the name agreed upon, at the *Yarmouth Snack*, where I shall lodge.’

‘Under what name, did you say ?’ asks the clerk. ‘I didn’t say any name, and I don’t mean to say any name,’ was my answer. ‘If Mr Byrle wants any more information, he had better write.’

‘Oh, very well,’ says he, quite short and sharp, for I supposed he did not like my manner, and away he goes.

I sat and thought, or tried to think, but I could not get on so well as before ; the visit of that young fellow had unaccountably upset me, and I

could not settle down again. Then in came first one, then another, then two or three of our men, and so I got up and went out. I had hardly turned the corner, when I met Inspector Maffery, and it was pretty easy to see by his rosy cheeks and unsteady eye what he had been up to.

'Off for a meditative stroll, I suppose, Mr Nickham?' he says. 'You are the boy for my money.'

'I'm glad to hear it, Inspector,' I said. 'But I don't think much of Mr Byrle's clerk, nor of Mr Byrle himself for his judgment in sending him to me.'

'Mr Byrle's clerk!' he says; and then repeats it: 'Mr Byrle's clerk!'

'Ah!' I said, 'Mr Byrle's clerk. He came with a message from Mr Byrle to know where he should meet me if he wanted to see me. I had already settled with him how I would call at his manager's private house with my report, whenever I had anything to say; and he ought to have been satisfied with that.'

'You are making some mistake here, Sergeant Nickham,' says Inspector Maffery. 'Mr Byrle had no clerk with him; and moreover than that, I've been with him myself till the last five minutes; till he got into the train in fact, and can swear he never spoke to anybody but myself from the time I left you.'

'Then there's a screw loose!' I said; 'there's a something wrong here, Inspector, and we have got to deal with some uncommonly deep files. They have scored the first notch in the game, that's clear; but perhaps we can turn the tables on them all the better for it.'

'If there's a man in the force as can do it, Sergeant Nickham, you are that man,' says Inspector Maffery; 'I'll trust it to you; for my head just now isn't up to the polishing off of such a business. But do what you like.'

'Can I have Peter Tilley for a week, Inspector?' I said.

'Have half a dozen for a month, if you like,' he answered: 'Mr Byrle is that much in earnest, Sergeant Nickham, and he is that rich and liberal, that he would buy up half a division rather than be beaten. So pick who you like, and keep them as long as you like. I will see you all right.'

'Very good, Inspector,' I said. 'Then I will have Peter to-morrow; and don't make any report of this little adventure, not even to Mr Byrle. I think I see the little game, and I will try to spoil it.'

If I had had any doubt as to the Inspector having had quite enough brandy-and-water with Mr Byrle (it was sure to be brandy-and-water, for Inspector Maffery never touched anything else; he said it was ordered for his liver)—I say if I had felt any doubt before, I should have had none after the way he wrung my hand and said: 'If there's a man in the force as can do credit to the force and bring 'em through in triumph, that man is Sergeant Nickham.' And so, with another squeeze of my hand, he walked away with a step so excessively solemn and stately, that it was only a little better—a very little—than staggering across the pavement, in the way of telling what was the matter with him; but Inspector Maffery was not a bad fellow, and never curried favour with those above him by worrying and spying on those below him, and so we liked the old boy.

Now this was a very awkward incident—I mean of course about the clerk—and shewed me

that my work had already begun, and was likely to be a little more intricate than I had expected. How the stranger came to know so much as he evidently did, I did not trouble myself just then to consider: he *did* know it; that was the fact I was concerned with. Why it was worth his while to take so much trouble about a small affair, I did not much care either, though this was more important, as it was evident some one had employed him, for I would swear he was no smith or fitter; and so it was clear there was a good many in the swim. I don't mean to use any slang if I can help it, but 'swim' is a regular word, you know, and we can't do without it.

My mind was at once made up; I was always very quick in making up my mind, and prided myself upon it. I am bound to admit I often got wrong through it, but perhaps no oftener than people who were slower; and I took care to make a good deal of the times when I was right, and so that covered everything. Now, Peter Tilley, the officer I had asked for, was a man as much about my size and build and colour of hair and eyes, as if he had been my twin-brother; and indeed he was not much unlike me in his features. Any one who knew us would not mistake us for each other, but a casual acquaintance might do so. I was wearing then rather extensive moustaches and whiskers; they gave me quite a military cut; and they were not common in the force then, though any man wears them now that chooses. I at once determined to shave them off—for I never allowed personal considerations to interfere with business—and make Tilley wear a set of false articles as much like my own as possible; and this I knew would immensely increase his resemblance to me as I appeared that day, while I should of course look very unlike myself. Then I would send Tilley to the *Yarmouth Smack*—which was a public-house at which, under some disguise, I had agreed to lodge while on my search—and he could keep his eyes open for anything going on; but he was not to trouble himself much. It was uncommonly likely, I thought, that the spies—for I didn't doubt there was more than one—would make sure that Smith or Brown or Jones, or whatever Tilley called himself, the lodger at the *Yarmouth Smack*, was Sergeant Nickham, and so, as long as they kept him in sight, they had the trump-card, if I may be bold enough to say so, in their hands. And if I had not met Inspector Maffery when I did, when the clerk's visit was fresh upon me, and I was rather cut of temper about it, I should probably never have thought of mentioning the matter, and the detective work would have begun on the wrong side.

Byrle & Co.'s factory was close to the Thames, and had a wharf in connection with it, and one waterside public-house would do as well for me as another. In fact, as the receiver was as likely to live on the opposite bank as on their own, I might actually gain by living at some place with the river between me and the factory, for a boat could easier cross the river in the dark than a cart could drive through the narrow streets and lanes without being noticed.

I told Tilley as much of my plan as was necessary; he was delighted to help me, for he fancied I was a rising man, and it was something of an honour to work with me. He was willing

enough to wear the moustache too; indeed this was such a common and natural sort of disguise, that it was adopted quite as a matter of course. I did not tell him that I wished him to be mistaken for me; I took care to choose the moustache and whisker; but it never occurred to him why that particular style was chosen; nor did I tell him, or Inspector Maffery or Mr Byrle, that I was going to shave. There's nothing like keeping your own counsel in these cases; and I resolved that if I had occasion to report anything to the inspector (for he was supposed to have the case in hand), I would actually wear a false moustache myself; but it was specially arranged that I should not go near any of the authorities until I thought it desirable, for Mr Byrle was of opinion that if the least suspicion got afloat with regard to myself, the men who were robbing him were quite fly to watching where I went. (I am afraid I have dropped into slang again; to be 'fly' to a thing, means that you are up to it, or down to it, as some prefer to say.) Well, this was Mr Byrle's opinion, and I am bound to say, after the visit of the sham clerk, it was mine too.

OUR IRON-CLADS.

IN our ballad literature not a little is heard of 'the wooden walls of Old England.' History is so full of exploits by three-deckers and frigates, that one feels as if the general disuse of these engines of naval warfare would lead to national disaster. England, however, does not stand alone in exchanging wooden walls for iron-clads of an entirely new type. All the navies of the world have been thus transformed in the twenty years which have elapsed since our last great war. There are ships of war now afloat which could single-handed meet and defeat the whole fleet that followed Nelson and Collingwood at Trafalgar. These great changes have been brought about by the use of armour-plating, the growth of the guns, the improvement of marine engines, and the adoption of machinery to aid in the working and the fighting of the ship. We remember a few months ago hearing one of our admirals, a man of the old school, talking of naval war. 'In past times,' he said, 'war was all courage and chivalry. What is it now? Cunning and machinery!' And to some extent he was right. Cunning and machinery will play a great part in the naval battles of the future; but of course there must be courage, and iron courage too, behind them, or iron plates and monster guns will avail but little. In the new class of war-vessels, the massive plates are bolted on to iron frames; the only wood is the 'backing' of Indian teak behind and sometimes between them. Oak, so far as beams and planks are concerned, has disappeared from the navy. The 'hearts of oak' are left, however, it is to be hoped, in the brave fellows who happily still man our new navy.

Our Navy List tells us that we have something like eight hundred ships of war, including in round numbers sixty iron-clads. These figures given in this way of course require some explanation. In the list are included gun-boats, tenders, store-ships, tug-boats, old wooden ships which are really waiting to be broken up, training-ships, and wooden guard-ships stationed at various ports. Our fighting navy really consists of the iron-clads

and the unarmoured cruisers built for high speed; to these we may add gun-boats of a recent type built to carry one very heavy gun. And with regard to the iron-clads it must be noted that even they are not all fitted to take a place in line of battle. Many of them are ships built from 1861 to 1864, having very thin armour, comparatively light guns, and we fear in many cases worn-out boilers. The *Warrior*, our first real iron-clad man-of-war (for we can hardly count as such the floating batteries), was launched in 1861. She was built on the lines of a fast sailing-ship, and has none of the heaviness of form which was unavoidably given to most of her successors. When she was launched, armour was still in the region of doubtful projects, and it was considered a remarkable success to give her four-and-a-half-inch plates on her central portion only, for the ends were wholly unprotected. The *Warrior* too was an enormously long ship—no less than three hundred and eighty feet from stem to stern; but even this length was exceeded in the sister ships *Northumberland* and *Minotaur*. These ships are neither strong in armour nor handy in manœuvring; they have of course their uses, but they cannot be compared with the later ships constructed when we had acquired some practical knowledge of what an iron-clad should be.

As soon as it was recognised that rapidity in manœuvring—in other words, power of turning easily and certainly—was a necessary quality of a good iron-clad, ships were built much broader in proportion to their length; and this facility of manœuvring was further increased by the general introduction of the twin-screw; that is, the placing of two screw propellers one on each side of the stern-post, each being independent of the other; so that one or both can be used to drive the ship; or one can be reversed while the other continues driving ahead; thus enabling the ship to turn as easily as a boat when the oarsman backs water with one hand and continues pulling with the other.

While the increase of armour kept pace with the growth of the guns, and rose gradually from four inches on the *Warrior* to two feet on the *Inflexible*, a species of internal defence was gradually developed by the division of the ship into numerous compartments; so that if she were pierced below the water-line by the explosion of a torpedo or the blow of an enemy's ram, the water would only partially fill her, and she would still be able to keep afloat. All the later iron-clads have a double bottom, the space between the inner and outer bottom being divided into numerous cells. The body of the ship is divided by the water-tight bulkheads extending from side to side, and from the bottom to the upper deck. To these transverse bulkheads Mr Barnaby, the present chief constructor, has added in all the iron-clads which he has designed a longitudinal bulkhead extending from stem to stern, and dividing the ship into two halves in the direction of her length. Further, there are minor compartments formed by strong bulkheads, designed for the protection of the engines and boilers. In a large ship these compartments of various kinds are very numerous; the *Inflexible* contains upwards of one hundred and twenty; great care, therefore, has to be taken in planning them, in order to insure that this isolation of the various parts of

the ship may not interfere with the working of her guns, engines, and steering apparatus while she is in action.

Side by side with this development of defensive power, there went on an equally rapid development of machinery and mechanical appliances for the working of the ship. The first necessity of an iron-clad is powerful engines, to drive her at a speed of thirteen or fourteen knots an hour on an emergency, though of course in ordinary times a much lower rate of speed is considered sufficient, and the engines work at half their power, or are stopped entirely, while the ship proceeds on her way under sail. But the propulsion of the ship is only one of the numerous duties to be discharged by this new adoption of steam, a power which was only just really establishing itself in our navy when we went to war with Russia in 1854. An iron-clad does not carry anything like the crew that used to be put on board of an old three-decker. Eleven hundred men used to be the complement of a ship of one hundred and thirty-one guns; one-third of the number is more than the crew of some of our most formidable vessels of to-day. In former days guns could be handled and worked by men and even by boys, provided the number of hands were sufficient; and nowadays it is very different work running in and out guns weighing thirty-five, thirty-eight, and eighty-one tons, and dragging along and ramming down shot and shell weighing from six hundred pounds up to three-quarters of a ton, and cartridges each of which contains perhaps more than two barrels of gunpowder. This kind of fighting is work for giants, and so the giant Steam lends his strong hand to do it. Steam turns the turrets of the monitor, steam exerts its force through the medium of hydraulic machinery, checks the recoil of the heavy gun as it runs in, forces the mechanical sponge into its bore, works the shot-lift that brings up the ammunition, works the rammer that drives it home into the gun; finally runs the gun out and points it, the huge gun raising or lowering its muzzle, or turning to right or left, as the captain of its crew touches a valve-handle or presses down a little lever.

But steam is not applied to the guns only; it works the windlasses, winches, and capstans that raise the anchors, braces up the yards, and lifts stores and heavy weights in and out of the ship, or moves them from place to place. It furnishes power to the steering apparatus, works the pumps, keeps the ventilating fans going; and in ships that shew the electric light at night it drives the electrical apparatus. Engines are made to start engines in some of the newer iron-clads. Instead of moving heavy levers when he wishes to set the engines going, the engineer just touches a miniature engine, which moves the levers of the larger engines for him. And all these more important engines are multiplied and made to act either together or separately, so that in the event of one being disabled, others are left to do its work. We hear of ships of war being fitted with twenty or thirty engines, without counting sundry smaller ones. Those of the turret-ship *Temeraire* are thus divided—two main engines for propelling the ship, with two starting engines; four feed engines, two circulating engines, two bilge engines, four fan engines, one capstan engine, one steering engine, two pumping engines connected with the

hydraulic loading-gear, two turning engines for rotating the turn-tables or turrets, two engines to pump water in case of fire, four engines for hoisting out ashes, one engine for condensing air in working the Whitehead torpedo, and an engine for the electric light apparatus. Admiral Fellowes had such ships as these in his mind when, speaking before a committee of the Admiralty, he said: 'Men-of-war now are nothing more nor less than floating machines; there are the steam capstans, the steam steering-gear; every portion of your guns, slides, and carriages worked by steam; there are the double bottom and the inner bottom, and everything connected with the machinery; in fact the whole ship is now a floating machine, and is more or less under the control of the chief engineer.'

In all our great naval wars, our ships had only a single weapon, the gun, and this not a very heavy one, for the highest limit of naval ordnance was the sixty-eight pounder, which indeed was looked upon as a very terrible weapon. To the guns of nowadays, the old thirty-two and sixty-eight pounders are mere pop-guns. There is the huge eighty-one-ton gun, twenty-four feet long, and six feet thick at the breech, its huge shot of fifteen hundred pounds being capable of penetrating thirty inches of armour. There is the thirty-eight-ton gun, whose shot of six or seven hundred pounds weight has smashed a thirteen-inch plate at a thousand yards. Then there are guns of six-and-a-half, nine, twelve, eighteen, and twenty-five tons, with projectiles weighing from one to six hundred pounds, all of them capable of piercing armour, against which the old naval guns would be as useless as a schoolboy's squirt. But the gun does not stand alone. There are two other weapons, either of which is more terrible, and in certain cases more effective than the heaviest gun afloat. These are the ram and the torpedo, the latter of which has recently been described in these columns. Let us, however, have a look at the ram. In the old days, the ship herself had no attacking power. She fought with her guns; or else she was laid alongside of her enemy, and the crew with axe, pike, and cutlass clambered over the bulwarks and on to the hostile decks, which they cleared by hand-to-hand fighting. Probably no iron-clad will ever be laid alongside of another to board her. Were an iron-clad to go into action, all the openings in the deck would be closed, and every one, even the steersman, under cover. Many modern ships could continue a fight successfully with a hundred or a hundred and fifty boarders in possession of the upper deck; and their own turret guns, or the fire of friendly ships, would clear away the intruders if necessary. Thus, in the recent war between Paraguay and Brazil, during one of the river engagements, a Paraguayan ship ran alongside of a Brazilian turret-ship and sent a crowd of boarders on to her iron decks. They met with no opposition; the round turret in front of them continued its fire against a Paraguayan monitor; while another Brazilian monitor sent volley after volley of grape-shot sweeping across the decks of her consort. In a few minutes they were clear. The Paraguayan boarders had been killed, had jumped into the water, or had escaped to one of their own ships. This, we believe, is the only attempt on record at boarding an iron-clad; its failure shews how hopeless such an enterprise is against

a ship the possession of whose deck does not give any control over her movements or those of her crew. It is therefore probable that it will be only in the most exceptional cases that iron-clads will approach each other with the object of boarding. If they do come to close quarters, it will be only to use the ram.

This idea of fighting with the ram is a very old one. The *beak* was the weapon of the ancient navies of the Mediterranean, and the beak was what we now call the ram. It is quite evident that to make the ship herself, weighing from nine to twelve thousand tons, take the place of the projectile, by driving her at a high speed against a hostile vessel, is to use a weapon more powerful than the heaviest gun. A ship like the *Inflexible* or the *Sultan*, with a speed of ten or twelve knots an hour, will strike a heavier blow than a shot from even the eighty-one-ton gun would give at a range of a few hundred yards; and while the injury done by the shot will probably be above the water-line, the ram will cut the hostile vessel down from above the water-line perhaps almost to the keel. Every one remembers how the *Iron Duke* sank the *Vanguard* by an accidental collision at a low rate of speed. But in this case the injury was such that the *Vanguard* did not sink for nearly an hour. Much more terrible was the sinking of the iron-clad *Ile d'Italia* in the battle of Lissa in 1866. The Austrian admiral found himself inferior in gun-power to the Italian ships; he therefore decided on using the ram as much as possible. 'I rammed away at everything I saw painted gray,' he said himself in describing the action. One of these gray ships was the splendid iron-clad *Ile d'Italia*, which struck fair amidships by Tegethoff's bow, went to the bottom of the Adriatic with all her crew in less than a minute. We believe that this use of the ram will play a great part in any future English naval engagement.

Such are the means of defence and attack possessed by our fleet. There has never yet been anything like a grand engagement between two great iron-clad navies; when that takes place, we shall see what the new naval warfare really is; meanwhile one thing is quite certain—that iron-clads are neither as handy nor as comfortable as the grand old ships of say forty years ago. Sailors in the royal navy have had to exchange the well-lighted, airy lower-decks of the line-of-battle ship for the hot dark 'compartments' of the iron-clad; for oil-lamps, hot rooms, and artificial ventilation, and perhaps the prospect of being battered with monster guns or blown up with torpedoes. This change of conditions may have serious consequences, not contemplated by designers of iron-clads. At present the crews of these vessels have been nearly all engaged as boys, put on board training-ships. They turn out a fine set of young men, but they do not remain in the service. Before they are thirty, most of them have gone, and are engaged in employment on shore, or in yachts, or in ocean steam lines. We believe there will be also a growing difficulty in procuring a good set of officers, including surgeons, for the iron-clads. Young men of good education, with numerous openings for them in civil life, do not like to be immured in dark floating hulks, with the risk at any moment of being helplessly sent to the bottom of the sea. We at any rate know the fact of two young men trained as surgeons for

the royal navy who on these grounds have turned from following their intended profession. In short, science may invent ships of overpowering destructive grandeur, but it cannot invent men who will agree to live under conditions of dismal discomfort in these floating dungeons. Such, we imagine, will be found to be weak points in a navy of iron-clads. Nor can we look with indifference on the many instances of disaster in the mere working of these new-fashioned vessels. Explosions and other fatalities follow in pretty quick succession. Furnaces and steam-machinery are constantly going wrong. Shafts and bearers are going wrong. There seems to be such a complication in all departments, that one can have little confidence in matters going quite right in case of that kind of active service involved in absolute warfare. A contemplation of these several contingencies, it must be owned, is far from pleasant.

Since this article was written, news has come of a successful naval engagement which shews that our sailors are as brave and as skilful as ever they were. One day last May a rebel Peruvian iron-clad, the *Huascar*, having committed piratical acts in the Pacific, was attacked by two of our fine wooden cruisers, the *Shah* and the *Amethyst*. The two English wooden ships fairly beat the iron-clad turret-ship, which was so damaged that the rebel crew were only too glad to go into harbour and surrender to the Peruvian authorities. This is the first English action with an iron-clad; and slight as it is in itself, the fact that our ships were only wooden cruisers meant for no such severe work, gives it some importance, and makes the victory a legitimate cause for well-founded satisfaction.

THE 'SOFTIE'S' DREAM.

IN TWO CHAPTERS.—CHAPTER I.

IN the fertile valley of the river Suck, just where some years ago such consternation was created by a portion of the Bog of Allen shewing an inclination to settle for good, there stood many years since a farm-house of rather a better class than any of those in the immediate neighbourhood, or indeed in any of the adjacent villages. The house stood a little off the high-road from Castlereagh to Loughlinn, and few people who passed failed to observe its well-to-do, comfortable appearance and 'smug' haggard (steading). Its occupier, Owen Kearney, was a very hard-working sober man, who not only minded his own business, but let his neighbours' affairs alone. He was never in arrears with his rent, had his turf cut a year in advance, and got his crops down first and in earliest; so that it was not without some reason that people said he was the most comfortable farmer in the village of Glenmadda. Added to being the most industrious, Owen Kearney was (what few tenant farmers in the west of Ireland were thirty years ago) something of a speculator. He did not tie his savings up in an old stocking and hide it in the thatch of the barn or cow-house, as the majority of his neighbours who had any savings usually did; but despite the repeated warnings of Shaun More Morris, the philosopher and wisacre of the village, invested in new and improved farming implements and in horses, of which he was not unjustly considered the best judge in the County Roscommon. As he did all his business when he was perfectly sober, he seldom

had any cause to complain of his bargain ; and the 'luck-penny,' instead of spending in the public-house, he made a rule of giving to the priest for the poor of the parish.

Not being in the habit of gossiping either about his own or his neighbours' affairs, no one could form any correct idea of how rich Owen Kearney really was ; but it was generally known that he kept his money at the bank, as on fair and market days he went into that building with his pockets well filled and came out with them empty, and mounting his cob, rode home quietly, long before the fun or the faction fights commenced.

Not so, however, the younger of his two sons, Larry, a wild restless lad of seventeen, on whom neither the precept nor example of his father and brother seemed to have the least influence. Martin, the eldest, was steady and thoughtful like his father ; but Larry, with his boisterous laugh and ready joke, dancing blue eyes and flaxen hair, never spent a minute in thinking during his life. While he worked, which was not often, he was as good as two, his father used to say ; and 'when he took his diversion he was the devil at it,' Martin used to add good-naturedly. Innumerable were the scrapes Larry got into, and miraculous were the methods by which he managed to extricate himself. There was not a wake, wedding, or christening for miles round that he was not to be found at. No merry-gathering or fair was complete without him ; and it was almost a proverb that Larry Kearney was the last to sit down wherever there was a dance, and the first to shake a shillelah wherever there was a shindy. Of course he was his mother's favourite ; such boys invariably are. She shut her eyes to his faults, supplied him with money without any questions, and being a very religious woman, or what in that part of Ireland is termed a voteen, she atoned for all his shortcomings.

There was another member of Owen Kearney's family as full of fun and mischief in her way as Larry ; this was Dora Costello, the farmer's orphan niece. Little Dora, everybody called her, because, when she lost her own father and mother, and went to live with her uncle and aunt, she was a little toddling thing of three years old. At the time this story tells of she was a fine girl of seventeen, tall, finely formed, and as graceful as a willow. A fine specimen of an Irish peasant girl was Dora Costello, with her red-and-white complexion, merry changeable hazel eyes, and rich, reddish auburn hair. There was not a farmer's daughter within many a mile who could *scutch* or spin as much flax of an evening, nor one who could better milk a cow or make a roll of butter. Bright, intelligent, and good-tempered, with a tongue as ready as her fingers, and a sense of humour as rich as her brogue, Dora was a general favourite, and as a natural consequence had numerous admirers. Being by nature somewhat of a coquette, she managed to play them off one against another with an ease and grace which a London belle might have envied, keeping good friends with all, and giving none the slightest preference. But when it came to a question of marriage, it was a different thing altogether. Dora declared she was very happy with her uncle and aunt, and unceremoniously refused all the eligible young men in her own and the next village, declaring of each in turn that she would 'as soon marry Barney Athleague.'

Long ago, in almost every Irish village there was to be found hanging about the farm-houses some poor half-witted creature, called in one place an *oncha*, in others an *omadhaun*, and in the County Roscommon a *soffie*. They were boys without any knowledge of who their parents had been, cast as children on the charity of some village, from which they usually took their names, as Johnnie Loughlinn, and Barney Athleague. How Barney came to make his way to Glenmadda no one knew, but one day when about ten years old he was seen following a hunt. Stumbling over a loose stone, he sprained his ankle, and so was thrown on the protection of the villagers. A glance at the lad's motley appearance and vacant face was sufficient to shew what he was ; and as in most parts of Ireland, as in Germany, there exists amongst the peasantry a sort of superstitious regard for silly people, poor Barney found food and shelter, now from one, now from another, as indeed the softies invariably did ; in return for which they ran on errands and looked after the pigs and poultry, and were always at hand in an emergency.

As a rule, the *soffie* looked a great deal bigger fool than he really was. He contrived to live and be fed, clothed and lodged without working. He made himself at home everywhere, was generally treated very well, and never by any chance treated badly. He knew everybody's business (for curiosity was one of his virtues or vices), and with the special advantage that people thought he knew nothing at all. All sorts of matters were discussed freely round the hearth in his presence, he meantime staring into the fire, sucking his fingers, or rolling on the floor with the dog, no more heeded than that animal ; yet all the while drinking in the conversation, and with a sort of crooked wisdom treasuring it up. Animal tastes and instincts were generally the most marked in the *soffie* ; as a rule, he was greedy, selfish, and uncleanly in his habits, violent in his antipathies, yet with a capacity for attaching himself with a strong dog-like fidelity and affection to a friend.

Such was Barney Athleague—perhaps a trifle better and more intelligent than the generality of his class ; and there was no place in the village where he spent so much of his time, or was so well treated, as at Owen Kearney's ; first, because they were naturally kindly people ; and next, Mrs Kearney's religious feelings made her especially good to the poor and friendless ; and there was no person in the whole world whom the *soffie* cared so much about as Dora. Wherever she went, Barney was not far behind. He was always ready to do anything in the world she asked him, no matter how wearisome or hazardous. When she was a child, he climbed the highest trees to get her birds' nests, tumbled like a spaniel into the river to get her lilies, and walked miles and miles to recover a pet kid of hers which had gone astray. As she grew older, he carried her cans when she went milking, fed her poultry, and in short waited on her and followed her about like a lapdog. It was great fun to the 'boys' who used to assemble in the farmer's kitchen of a winter's evening to tell stories and gossip, to see Barney fly into a furious passion if any one he did not like touched Dora, or even put his hand upon her dress.

One of the persons the poor *soffie* most cordially detested was Larry Kearney ; perhaps because the young man was too fond of teasing him, or else too

much given to sitting beside Dora. How or whatever the cause, the poor fool hated him; but with a prudence which one would hardly have expected in a softie, he kept his opinions to himself, and watched his enemy like a lynx. Not once or twice he saw the young man descend from the loft where he slept with Luke the 'help,' after the family were sound asleep, and opening the door, steal noiselessly from the house; and after much consideration, Barney at last made up his mind to follow him and learn his destination, nothing doubting but it was the village public-house or *shebeen*, or the forge, which was often a haunt for the idlers to play cards and get tipsy in. But Larry took the very opposite direction from what the softie imagined. Crossing two or three fields, he skirted a plantation of ash, on the other side of which was a *rath* or *forth*, said to be haunted, and the resort of 'the good people.' The place was very generally avoided after nightfall; and Barney's courage was beginning to fail him, when Larry was joined by three or four other young men, which revived his spirits, and nerved him to follow silently and cautiously as a cat.

On rounding the hill he saw there were between thirty and forty persons assembled in a field, and after a few minutes one of them advanced to meet Larry. The softie, on seeing the man approach, concealed himself behind the ferns and brambles, all his curiosity aroused, and strained his ears to catch the conversation; but the men spoke so indistinctly that he could not distinguish a word till after a little while they drew nearer to his cover.

'Look here, Larry,' one said, drawing something which gleamed in the moonlight from a cave or hollow in the hill-side, within arm's length of Barney's crouching form. 'Look, me boy, there's twoscore pike-heads lying snug enough in there.'

'Good captain,' Larry replied, with his merry laugh, 'an' there's two-score "boys" ready to handle them.'

'Yes; but we want more,' the captain said, as he replaced the weapon in the cave, and carefully drew the thick grass, ferns, and blackberry bushes over it. 'Did you speak e'er a word to Martin?'

Larry laughed again. 'Sorrah a word, captain; an' if "Molly" herself was to go an' ax him, he wouldn't join us,' he said; 'an' bedad, maybe he might inform!' he added merrily—and the men moved away.

'Ha, ha!' Barney said to himself as he crept from his hiding-place, and made his way back to the farm-house; 'that's where Larry goes. An' who's Molly, who's Molly? I'll ask Miss Dora to-morrow who's Molly;' and with this reflection he crept into his bed and fell asleep.

CHAPTER II.

'Father, I think I'd like to join the Volunteers,' said Martin Kearney one day, about a month after the above event; 'the country is in a bad way, an' it's time for them that love peace and quietness to spake up.'

'True for you, Martin; an' if I was younger I'd do the same thing,' Owen Kearney said, looking up from the newspaper, in which he was reading an account of the arrest of several of the rebels known in 184— as the *Molly Maguires*, from their having first met in the house of a woman of that name. 'It's bad for the poor boys that went with the "Mollies."'

'Will you join with me, Larry?' Martin asked. But he shook his head, as he replied somewhat hastily: 'Not I, faith; the "boys" never did anything to me.'

'An' I'm not going to do anything to them,' answered Martin quietly. 'Only, I think it's right for us to shew that we're honest Roscommon boys, an' have nothing to do with villains who go round the country at night frightening women an' children, an' murdering poor innocent cattle, not to mention shooting their next-door neighbour from behind a hedge, without any reason. I know I'd liever be a sheep-stealer than a Molly Maguire; an' to shew I have no dealings with them, I'll go to-morrow to Boyle an' list in the Volunteers.'

Larry used every argument to prevent his brother going to Boyle as he said, but without any avail; and early the next morning Martin started to do what numbers of the better class of farmers' sons in the vicinity of the small towns had already done.

About twelve o'clock on the night that Martin left his home, Owen Kearney and his wife were startled out of their sleep by the softie rushing into their room screaming wildly that he had a dream.

'An' what was it, Barney?' asked Mrs Kearney kindly. 'Don't be frightened now; but tell me.'

'Arrah, ma'am,' he sobbed, 'I dreamed I saw Martin; an' two men with their faces blackened rode up to him on the plains of Boyle an' shot him. Oh, *wirra, wirra*, one of them was Larry!'

Poor Mrs Kearney fell to wringing her hands, and sobbing wildly at the extraordinary dream of the poor fool; while her husband rushed to his son's room in the hope of finding Larry; but his bed was empty, as was that of Luke the servant. Full of terrible forebodings, the farmer began to question Barney more particularly as to his dream; but he could only repeat again and again that two men fired at Martin on the plains of Boyle; one of them was Larry, the other was Luke: this he maintained with a persistency which it was almost impossible to doubt. No one thought of returning to bed; and while they were consulting as to what was best to be done, the softie again uttered a wild shriek, and rolled over on the floor, as a bullet entered the kitchen window and lodged in the opposite wall, followed by another, which whizzed past Owen Kearney's head.

'The Lord have mercy upon us!' he exclaimed, crossing himself devoutly. 'Where will it end?' And he held his wife, who was almost insensible from the fright, close in his arms. At that instant a bright light illuminated the whole kitchen; and in a moment the truth flashed across his brain—his steading was in flames. Not daring to open his door to look out, he tried to think what was best to be done; for perhaps the house over his head was blazing too, or would be in a few minutes. Casting a hasty glance round, he lifted his wife in his arms, meaning to carry her to the front of the house and out of sight of the flames; when a violent knocking at the door startled him, and he recognised his niece's voice demanding admittance. Hastily unbarring it, he saw her accompanied by a party of soldiers, who, when they found no lives had been taken, set to work bravely to protect the property which was yet untouched by the fire. But there was little left for them to do. The cattle had been hamstringed, the horses stolen, and a lighted brand placed in every stack of oats and

the thatch of every outhouse. The work of devastation had been done only too well.

'They're taken, uncle—them that set the haggard a-fire,' said Dora as soon as she was able to speak. 'I brought the soldiers to the house; and,' she added, 'one of the villains said he had finished off Owen Kearney. Thank God, it is not true!' and she threw herself into his arms.

'Yes; I heard him,' said one of the soldiers; and we've sent him to safer lodgings than we took him from. It seems, Mr Kearney, that your niece was returning home from a visit to a neighbour's, when she heard two men whispering in the lane at the end of the meadow. As they were in front, and she didn't like their looks, she kept behind, and heard them say that there were two gone to Boyle to look out for the *Volunteer*, and that they were going to do for old Kearney and his wife, "string" the cattle and fire the haggard. Like a sensible girl, she turned round quietly and ran as quick as she could towards Castlerock. By good luck she met us half-way; and though we were going on another errand, we turned back at once with her, and netted the rascals who did this pretty piece of business.—I sent six men on towards Boyle, to see if they could learn anything of the villains that followed your son,' added the sergeant.

'Where's Larry, uncle?' asked Dora, after she had tried ineffectually to console her aunt. 'Why isn't he here?'

'You're all I have now, *alanna*,' Kearney said, pressing her to his breast. 'Martin is gone, and Larry is gone. Well, well, God is good.'

'Miss Dora, Miss Dora!' cried Barney Athleague faintly, 'come here a minute.'

In the general confusion, every one had forgotten the poor softie, who lay on the floor quite insensible.

'What is it, Barney? Are ye hurt?' inquired Dora, bending over him.

'Not much; only my back is bad, and I can't lift my legs. Tell your uncle Owen Kearney that Martin isn't dead. He's lyin' on the settle in a shebeen with his hand on his side, calling "Dora, Dora!" I see him—sure I see him; and Larry an' Luke is took; the sogers is bringing them to Roscommon. Oh, wirra, wirra!'

'Shure the poor creature is frightened to death's door,' said Owen Kearney, trying to induce Barney to get up and drink a little water; but the mug fell out of the farmer's hands in dismay and horror, for he found the poor softie was bathed in blood. 'He's shot, he's shot!' he exclaimed; and one of the soldiers drew near and examined the wound.

'There's a bullet in his back,' the man said; 'and he'll never eat another bit of this world's bread. And may God forget the man that forgot he was an omadthaun.'

Poor Barney never spoke again. Nothing could have saved his life. But his dream was literally true. At the very moment he awoke screaming, Martin Kearney was fired at by his brother Larry and his father's servant; at the hour he mentioned were the murderers taken; and Martin himself was taken into a shebeen, as he said, and laid upon a settle in the kitchen, where he called untiringly for his cousin Dora.

Such was the softie's dream; and such sad stories as that above related are a part and parcel of every Irish rebellion. Martin Kearney did not

die; and Larry pleaded guilty, declaring that he was forced to attempt his brother's life both by solemn oath of obedience and by lot; at the same time confessing all he knew of the strength and doings of the Mollies, assuring his judges that he joined them in ignorance, and now thought of them only with horror and regret. Therefore, in consideration of his youth, repentance, and valuable information he gave with regard to the rebels, his life was spared, and he was instead sentenced to twenty-one years' penal servitude; while his companion, Luke Murphy, was hanged. It would have been almost a kindness to Larry to have been permitted to share the same fate. Before two years he died of a broken heart.

Owen Kearney's house was not burned; but after his son's transportation, nothing could induce him to live in it. He therefore sold his furniture and such of his stock as the cruelty and violence of the Mollies spared, and went to end his days amongst his wife's relations in the County Galway. Dora and Martin were married, and after some time emigrated, and spent the remainder of their days in comfort and happiness, clouded only by the memory of how much pleasanter it would have been if they could have settled down in the old farm-house dear to them both, to be a comfort to their father and mother in their old age, and at last to sleep beside them in Glenmadda churchyard.

The stock of one of the wealthiest gentlemen in the County Roscommon now graze where Owen Kearney's house once stood. Not a trace of his family remains in the Green Isle. Their tragical history is almost forgotten; but amongst the gossips and old women the softie's dream is still remembered.

GLIMPSE OF THE INDIAN FAMINE.

ON this dismal subject so much has lately appeared in the newspapers that we almost shrink from troubling our readers with it. Everybody knows the cause of the famine—a long and unhappy drought in Southern India which parched up the land; nothing would grow; the people, millions in number, had saved nothing; their means of livelihood were gone; and with a weakness which we can scarcely understand, they sat down to die—of starvation. In times when India was subject to Mongol rulers, the population, on the occurrence of such a catastrophe, would simply have been left to die outright. Famine, like war, was deemed a legitimate means for reducing a redundancy in the number of inhabitants, and was accepted as a thing quite natural and reasonable. Matters are now considerably changed. India is part of the great British empire, and British rule is no doubt a fine thing to be boasted of. It gives the English an immense lift in the way of national prestige. Along with prestige, however, come responsibilities that are occasionally found to be rather serious. The bulk of the people of India are living from hand to mouth. If their crops fail, it is all over with them. Then is heard the distant wail of famine from fellow-subjects, which it is impossible to neglect. Noble subscriptions follow, although subscriptions of one sort or

other come upon us annually in regular succession from January to December. But when was the Englishman's purse shut while the cry of distress was loudly pealing around him?

There is much satisfaction in knowing that more than half a million sterling has been gathered for the assuagement of the Indian famine. Although vast numbers perished of hunger, vast numbers were saved by a well-conducted system of dispensing food suitable to the simple wants of the people. The natives of Southern India live chiefly on rice, and a little serves them. The distribution of rice was accordingly a ready and easy method of succouring the poor famishing families. Along with boiled rice there was usually given a cup of water, rendered palatable by some sharp condiment, such as pepper or chillies. This desire for hot-tasting condiments seems to be an inherent necessity in warm climates, for which Nature has made the most beneficent provision. With these few preliminary remarks, we proceed to offer some extracts from the letters of a young medical gentleman connected with the army at Madras, descriptive of the plans adopted to feed the assembled crowds who flocked to large camps or barrack-yards in a state of pitiable suffering. The letters were no way designed for publication, a circumstance which gives them additional value.

'MADRAS, July 25, 1877.—There is not much news this week. One day I drove out to one of the Relief Camps beyond Palaveram to see it. A most curious and interesting sight it was. We went at half-past five, which was feeding-time; and there we saw nine thousand five hundred starving wretches all seated on their hunkers [crouched down in a sitting attitude on their heels], awaiting their food. What a motley crew and queer mixture of old men with more than a foot in the grave; strong men and young women and unweaned babes all mixed indiscriminately, but all seated in long rows of about a hundred each, in perfect order, and kept so by not more than a dozen native police with two half-caste inspectors. The majority of the people were Pariahs. Few caste people care to come to the camps, and prefer to die rather than have their food cooked for them by non-caste persons. However, there were some—about two hundred in all—Hindus and Mohammedans, and they were set apart from the Pariahs.

'The food, rice, is cooked in enormous chatties, and then spread out on matting to cool; after which it is put into gigantic tubs, which are carried slung on bamboos by a couple of coolies to the people, and a large tin measureful given to each. A measureful of pepper water (a mixture of chillies and water) is also given to each, and as much drinking-water as they like.

'So much for the food; now for the camp itself. It is situated on a large plain, and the inclosure is about a mile round. It is in the form of a square, three sides consisting of chuppers [a kind of wood and matting tents], roofed in, and protected from the

wind on one side, being open on the other. Each of the three chuppers or houses of accommodation is built of the very simplest material: the floor is hardened mud, perfectly smooth and comfortable, as you know the people make it; while the roof consists of leaves matted together, supported on bamboos, and the side of matting. Each chupper is about a quarter of a mile long, and has accommodation for no end of people, the evils of overcrowding being avoided by the almost free exposure to the air. To windward is the Hospital, a good building, rain-proof, and covered in on all sides. Still further away are cholera and small-pox hospitals. The people at the camps receive two meals a day of rice and pepper water; and once a week on Sundays they get mutton. At this camp alone not less than fifty bags of rice were cooked and consumed daily, sometimes much more. The camp is open to all comers, and each is provided with a cloth and residence. The people appear all to be contented and happy, and await their turn for food calmly and patiently. The feeding is proceeded with rapidly now; but when first the famine came, it was not so; and owing to the paucity of servants, the feeding used to last from five P.M. till five the next morning. Rather trying for starving people to wait that time; hard too on the servants. Now, thanks to good administration, the feeding is all finished in about three hours. I was struck on the whole with the aspect of the people; they all with few exceptions looked well and in good condition. However, the Inspector said, had I seen them when they first came, it was different, and that if they were to return to their own villages, they would be dead in a few days. In fact, all the villages round are empty. Rice has now reached the appalling price of three and a half measures for the rupee, and of course one has to pay all one's servants extra. The poor cannot live, and they say the famine is getting worse! Only one man did I see who was lying among the others. Poor fellow! he had just managed to crawl into camp, and he was dying. I ordered him to be removed to the Hospital, a living skeleton.

'The Hospital was truly a sad sight, the saddest I ever saw. There in one ward, lying on the floor, were a dozen beings, literally living skeletons, with sunken eyes, and ghastly hollow cheeks, and livid lips, with their bones almost protruding through the flesh; too ill to move, and barely able to turn their glassy, stony stare upon you. Yes, dying all from starvation, and being hourly brought nearer death by wasting diarrhoea or dysentery.

'One woman I shall never forget. She had her back to me, and her shoulder-blade stood out so fearfully that I gazed upon it in momentary expectation of its coming through the skin. So awful was it, that I felt almost tempted to take my nail and scrape it, in order to see the white of the bone. Perhaps the saddest sight of all was the lying-in ward, where a lean mother was to be seen unable from weakness to nurse the bag of bones she had given birth to; barely a child surely, with its huge head and sunken eyes and its projecting wee ribs. Poor infant, it couldn't live long.'

'August 7.—This morning I was up at five, and after my breakfast of porridge and goat's milk, was driving out to Jeramuchi Famine Relief Camp, eleven and a half miles distant. The camp is much the same as the Palaveram one I already described to you; but it is superior, and more luxurious in some ways. It is not built in the form of a square, and is all the better of that, I think. It is fenced in all round with a trim palisading, as was the other camp, sufficient to prevent the people straying at night. The chuppers are arranged on the pavilion system, right down the centre of the camp. During the day they are entirely open at both sides, therein differing from the Palaveram ones, where one side is always closed. However, at night either side can be closed, as the sides consist of pieces of matting on a wooden framework, which is hinged to the side of the roof; and during the day the sides are all put up, supported on two bamboos each.

'The children at this camp are all collected together and fed first, the grown-up people afterwards. This morning I saw five thousand children, in age from twelve to infants, mustered for breakfast. An old gentleman with great swagger played a tom-tom with a couple of sticks; it was in the shape of a kettle-drum, and they all mustered, standing up in a row. M—— and I walked down two streets of these children. They were almost all bright and happy-looking; and on being asked if they had enough to eat, they all replied in the affirmative, save one boy about twelve, who shook his head and snote his belly. Poor creature; his looks confirmed his words; there he was on two legs like walking-sticks, mere bones without an atom of muscle, on which he could hardly stand. On being asked when he came in, he said last night. Where were his father and mother? Oh, father, mother, brother, sister, and he all left village together; walked many, many miles; no food. First sister, then mother, died on the road; then brother; yesterday father; he alone being able to reach the Relief Camp.

'This tale is only a repetition of dozens of the same. He has ordered milk and port wine as extras; and I hope the poor orphan being will recover. We went over the rest of the camp; saw the men and women all sitting patiently in rows in their dreamy eastern way, silently awaiting the summons of the tom-tom after the children's breakfast was over, to call them to theirs. On coming to the Mohammedan women, about thirty in number, they all promptly stood up. One could not but be struck with their appearance, so fair-skinned, clean-looking, and handsome, compared to the Pariahs and others. They all spoke Hindustani of course, and were most polite and respectful. Despite the poorness of their attire and the absence of their jewellery, they had a refined air about them, and a superior look totally foreign to the ordinary Hindu. One young girl I was particularly struck with; she could only have been about fifteen, with most lovely eyes and perfect teeth, and such a figure. Ah! I thought, if this young woman was dressed in European clothes and was a lady, she would make a figure in London. Dressed in a scarlet and golden saree, with bangles and other jewellery, she would to my mind have been the realisation of my idea of an Indian princess.

'The Hospital presented the same sad scene of cases of emaciation as at Palaveram; there were

more than one hundred cases of dysentery and diarrhoea. I also saw another case of a milkless mother trying to suckle her newly born handful of bones in the lying-in ward. It is a mercy with such a large community that no cholera prevails. They have about twenty cases of small-pox. Leaving camp, we saw two stretchers coming in with coolies. Every morning the highways and byways are searched for three miles round; and those poor creatures who have died or are found dying, unable to come to camp, are brought in. If dead, they are at once buried about a mile away from camp; if alive, they are sent to Hospital. The famine continues very bad; and there was a great meeting in Madras at the Banqueting-hall, when it was acknowledged government could not now cope with it without extraneous aid. Accordingly a telegram was despatched to England, calling on the Lord Mayors of London, Dublin, Manchester, Liverpool, and the Lord Provosts of Edinburgh and Glasgow, to open subscription lists. I am sure it is a worthy cause. . . . In Mysore alone there have been more deaths the last three months than during the last five years. The Viceroy is said to be coming down immediately from Simla to personally inspect the state of matters.'

In a subsequent letter, October 25th, the writer adds—'The accounts are still dreadful. Many poor creatures die after reaching the camps, from inability to swallow or receive the nourishment offered to them in the hospitals. The day the Viceroy visited Bangalore, no fewer than ninety dead bodies were found in the streets and the bazaar. The people at home have certainly done much to help their poor brethren in India; but I believe they would do still more were they to be thoroughly aware of the terrible scenes which have come under my notice.'

In conclusion, it is not out of place to say that the frequently occurring famines in that country call for measures of prevention as well as temporary aid. In making roads and railways, the English have done vast service to India; but something equally imposing in the way of irrigation from artificial tanks and from rivers has seemingly become an absolute though costly necessity, for only by such means can a repetition of these dire famines be averted. In this direction evidently lies the duty of legislators, and we hope they will, with considerate foresight, be not slack in its performance. There might also, possibly, be something done by enabling masses of the redundant population to emigrate, under safe conduct, as coolies to countries where their labour is required. W. C.

A BURIED CITY.

THE history of the destruction of Herculaneum and Pompeii under the ashes of Vesuvius is well known; but long before that period, and contemporary with the age of Stone, a city in the Grecian Archipelago was buried in the same manner, with its inhabitants, their tools, and their domestic utensils. Here they have lain for thousands of years, until M. Christomanos, Professor of Chemistry at the University of Athens, called the attention of the public to them.

There is a small group of islands to the north of Candia where these discoveries have been made, chiefly in Santorini and Therasia, which with one

or two others form a circle round a bay. The two already mentioned are in the shape of a horse-shoe, with the concavity turned inwards, rising from the bay in almost inaccessible cliffs. Horizontal strata of deep black lava, layers of reddish scoria, and cinders of violet gray, are unequally distributed over these steep rocks, the whole being covered by pumice-stone of a brilliant whiteness. A few banks of marble and schist crop out to shew the original formation over which the volcanic ashes have poured; and long vertical streams of what has been molten matter can be traced down the cliffs. On the opposite side, facing the open sea, the islands are altogether different, sloping gently down, and covered with pumice-stone, the light fragments of which are soon displaced by the wind, and sometimes carried to great distances by the equinoctial storms. A few villages are scattered about, and the vine clothes the ground with its beautiful greenery.

From time immemorial the pumice of Santorini and Therasia has been dug out for building houses; and when mixed with lime, it affords an excellent cement, acquiring such hardness that it resists shocks of earthquakes and the action of air and water. It has been used for building piers and moles along the Mediterranean; and recently the works at the Isthmus of Suez and the ports of Egypt have given a great impetus to the trade, and thus opened out the underlying soil and remains of human habitations. There are immense quarries where the stone has been worked; the material being transported to the edge of the cliff, and thrown down a *glissade* about a hundred and fifty feet high, to the side of the ships awaiting it. Contenting themselves with cutting up the highest layers only, the workmen avoided the lower part, which seemed to be mixed with stony masses. These hindered their work, and were not valuable; but upon examination they prove to be walls of ancient houses. This had no interest for the owners of the land, who had long been aware of the fact; but an accidental visit from M. Christomanos awakened the interest of scientific folks at Athens.

At first the idea arose that this was an ancient burial-ground, and that the tombs had been hollowed out of the pumice-stone after the volcanic eruption; but it is now fully ascertained that they were built long before. The largest edifice, which has been cleared of the tufa which fills it, consists of six rooms of unequal size, the largest being about eighteen feet by fifteen; and one wall extends round a court of twenty-four feet in length, with a single entrance. The walls are built in quite a different manner from the fashion now used in the islands; they are formed of a series of irregular blocks of lava, uncut, laid together without any order; no mortar, but the interstices filled with a kind of red ashes. Between the stones, long twisted branches of the olive-tree are laid, still covered with bark, but in a very advanced state of decomposition. The wood has become nearly black, as if burnt, and falls to powder at the slightest touch. The inside of the rooms has never been whitewashed; but probably a rough coating of red earthy matter, similar to that which lies between the stones, has been put on.

At the north side there are two windows; a third and a door are found on the other sides, and several openings into the different rooms. As

these were formed by pieces of wood, which have decayed, the situation of the openings is chiefly ascertained by the mass of stones that have fallen in. In every case the roof lies in the interior of the rooms, and has been formed of wood laid upon the walls in such a manner as to be sloping; whilst in the largest apartment a cylindrical block of stone buried in the floor, has evidently supported a beam of wood, from which radiated the other pieces of the roof.

The things which have been discovered in this building are numerous and varied. There are vases of pottery and lava, seeds, straw, the bones of animals, tools of flint and lava, and a human skeleton. It may be remarked that not one article of iron or bronze has been found, not even the trace of a nail in the pieces of wood which have formed the roof; the absence of metals is complete. The pottery is all well proportioned, the commonest kind consisting of yellow jars, very thick, and capable of holding many gallons. They are filled with barley, the seeds of coriander and aniseed, gray peas, and other articles which cannot be made out. The form, material, and size resemble the jars used in Greece for keeping cereals in very early though historic times. In many of the rooms, heaps of barley lie against the walls. There are smaller jars of finer ware and a brighter colour, ornamented with circular bands and vertical stripes. The colouring-matter, of a deep red, has been put on in a moist state without variety of design, being always in circles and straight lines.

Besides a double necklace and ear-rings of a woman, many articles made of obsidian, a volcanic product sometimes called volcanic glass, have been found in Therasia. These are cut, but not polished; some of a triangular form have probably been the points of arrows; others are like small knives or scrapers for preparing skins. The use of obsidian appears to have been common during the Stone age among those nations who lived in volcanic regions, and even in later periods. It is said that it is still used by the women of Peru for scissors. It was more generally in vogue before the discovery of metals than since, particularly in Greece, where arms and tools of stone disappeared after copper was found. In the strata where they are at Therasia, there is nothing of iron or bronze.

Two small rings of gold are rather remarkable; they are so small that they would not pass over a child's finger. It may be inferred that they were links of a necklace. In each there is a hole about the size of a needle's eye. Probably they had been threaded one after another on the same string, and not interlaced like the rings of a chain. The interior is hollow; and no indication of soldering can be perceived, neither does the gold seem to have any alloy of other metal. The maker had flattened the bit of native gold by hammering it to the state of a thin circular leaf, and then folding it up with the edges to the inside of the ring. As gold has never been found in Santorini or in any of the neighbouring volcanic islands, it proves that the inhabitants held communication with the continent; certain streams of Asia Minor having been celebrated in antiquity for the great quantity of gold brought down.

Geologists have endeavoured to draw out the history of the terrible event which overwhelmed

these islands and their inhabitants. At the beginning of the tertiary period, Greece, united to Africa, seems to have formed part of a large marshy continent, where now flows the Mediterranean. It was inhabited by those gigantic mammals whose bones have been largely found in Africa. Towards the close of this epoch a lowering of the land separated Europe from Africa, and gave to the Mediterranean its present configuration. An oscillation of the crust of the earth afterwards produced openings, through which igneous matter has flowed. Torrents of lava gave birth to the volcanic rocks which are to be found in Greece and the neighbouring islands, and a volcano had evidently opened in the present bay of Santorini. The hill Saint Elias, the top of which forms the culminating point of the island, was then an island composed of schist and marble. The igneous matter, cooled by contact with the water and the atmosphere, attached itself to this hill, and the whole united together, formed the space now occupied by Santorini, Therasia, and Aspronisi. Repeated layers of lava, scoria, and ashes collected during many ages when the crater which occupied the central part was gradually becoming undermined.

Volcanoes are the weak parts of the earth's crust; there is not one in full activity which does not present alternative series of increase or lessening. The cone rises gradually until by degrees it is obstructed with lava, then a sudden fall destroys it and hollows a new crater, sometimes larger and deeper than the first. Many such occurrences have been described, but none can equal in importance the gigantic fall which formed the Bay of Santorini. All the central part must have given way, and been suddenly ingulfed, leaving but a narrow border of land, through the northern part of which the sea has dashed to fill up the hollow. Instead of a mountain three thousand feet high, there is a bay of immense depth, surrounded by precipitous rocks, close to which ships can anchor.

This violent catastrophe must have taken place when man was on the island; and the event must have been sudden, since the remains prove that there was no time to move away or to displace anything in the houses. The eruption of pumice-stone has preceded the sinking of the cone, for the tufa which covers the downs is cut through by subadjacent streams of lava; nor does it seem to have been preceded by any violent earthquakes, as in that case the houses found in Therasia would have been demolished and the walls no longer standing. This is remarkable, as the construction of the buildings proves that the island was subject to them; the pieces of wood inserted in the walls seeming to be for no other object than to prevent the disastrous effects of such a shaking. This custom is still in use among all the islands of the Archipelago.

From the abundance of wood used in the houses, the island must in those days have been well supplied with timber. The olive-tree grew freely, and barley was the commonest of the cereals. Probably too the climate was different. The vine does not seem to have been there; still less was it the only plant cultivated, as now, at Santorini. The population were husbandmen, understanding how to grind barley in mills and make it into bread; how to press oil from olives, to bring up cattle, and to weave stuffs. Yet the great

abundance of utensils of lava, obsidian, and flint, without any metals, shews that theirs was the age of stone, when the use of metals was unknown. The blocks of stones at the angles of the house at Therasia and the column standing near, indicate considerable skill in the workmen, when the kind of tools they used is taken into consideration; whilst the vases of pottery-ware are remarkable for their elegance of form.

It only remains to consider how many years ago it is since this great eruption took place. The data are vague, but geologists have tried to make some approximation. It is well known that after any violent catastrophe the subterranean forces seem to be exhausted; the periods of repose in a volcano are proportional to the previous energy. About one hundred and ninety-six years before Christ there is the record of an eruption, which raised in the centre of the bay a small islet called Palæa Kameni. After the Christian era, frequent slight emissions only served to increase the size of the island, and during the middle ages there was a period of calm. In the fifteenth century the excitement again burst forth, raising reefs both inside and outside the bay. The second duration of rest was about ten centuries; so that to the first, according to its intensity, there may be calculated at least twice that time; thus the formation of the bay was perhaps two thousand years B.C.

Historical records furnish more positive teaching, as the bay certainly existed fifteen hundred years B.C. It was at this epoch that the islands of the Greek Archipelago were invaded by the Phœnicians. This nation occupied Therasia and Santorini, as the many ruins still to be found testify, and they are built on the top of the pumice-stone. But the great eruption must have been long before that, since thick beds of pebbles and shells, from fifteen to twenty yards deep, lie on the tufa; and geologists know well, from the habitual slowness of this raising of the soil, that it corresponds to many centuries. There was also a population on the islands differing from those who were buried in the ashes, and from the Phœnicians. The latter knew the use of bronze, and introduced it on all the shores of the Mediterranean. Most likely we may place the great event during the early days of Egyptian civilisation, which some historians compute to be four or five thousand years ago. The primitive population present no trace of the influence which that nation exerted, and with which commerce would have placed them in frequent relations.

The Conductors of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.

2d. To insure the return of papers that may prove ineligible, postage-stamps should in every case accompany them.

3d. MANUSCRIPTS should bear the author's full Christian name, surname, and address, legibly written.

4th. MS. should be written on one side of the leaf only.

5th. Poetical offerings should be accompanied by an envelope, stamped and directed.

Unless Contributors comply with the above rules, the Editor cannot undertake to return ineligible papers.

A TALE OF THE COVENANTERS.

SOMETHING like two centuries ago, while the persecution against the Covenanters was raging in Scotland, many were forced, for conscience' sake, to give up all and retire to out-of-the-way places, to be out of the reach of their enemies. Among others, a well-to-do farmer of the name of Mac-William, reduced to penury by the fines imposed upon him and the confiscation of his lands, withdrew from the home of his youth; and having rented a moorland farm in a remote parish of a neighbouring county, he settled down there with his wife and family. Hillfoot—for such was the name of the farm—lay in a hollow between two hills of moderate elevation, which rose with a gentle slope on each side. A burn ran through the farm, and about two miles farther on, joined a river of some importance. Almost at the confluence of the two the glen took a sharp turn to the left, and thus rendered Hillfoot invisible from the main road, which followed the course of the larger stream.

Though the farm was of considerable extent, little more than a living for the family could be made about it, for heather was more abundant on the hills than grass; and good arable land was out of the question, for the district was so late that cereals could barely ripen, and even the meadows along the holms by the burn-side yielded but scanty crops. It was in this place, however, that James MacWilliam had elected to spend his latter days. All around the house the outlook was no doubt bleak and bare and far from encouraging; but all that he loved most dearly were with him, and if he had not the comfort and luxury of former days, he had what he prized more than all earthly things—freedom to worship God in the way it seemed best to himself. At the time of his removal to Hillfoot he was about forty years of age, and his wife two or three years his junior. They had been married some fifteen years, and two children—a son and daughter—

had blessed their union. John, a lad of fourteen, assisted his father in the tending of their flocks and in the working of the farm; while their daughter Barbara, two years younger, helped her mother in the house; and although she was not strong enough yet to do the heavy work, by the sweetness of her temper and the blitheness of her nature her presence enlivened all about her and made the heavy task seem light.

Years rolled on; and though they often heard of the persecution and dreadful punishment their fellow-countrymen, nay even their fellow-parishioners were suffering, still in their remote and unsuspected retreat they were allowed to live on in peace. Ten years had passed, and with them many changes had come over Hillfoot and its inmates. Death had not left it inviolate, for the wife and mother, not strong at best, had been ill able to stand the privations and hardships which the family had endured since settling there. It was with sad hearts that her husband and family saw her pining away; and although they put forth every effort and tried every expedient that love could devise to prolong her life, she sank lower and lower; and when autumn was merging into winter, and the heather-bells were beginning to wither, she passed away. Barbara, on whose shoulders the household duties had long before this fallen, was now no longer a girl, but a comely lass of twenty-two. Her tall graceful figure, kindly manner, and sweet disposition made her beloved by all who knew her, and brought her many admirers. She had become betrothed to a young man, a shepherd on a neighbouring farm, and but for the ailing health and subsequent death of her mother, was to have been married the following summer.

John, on whom, from the decrepitude of his father, the management of the farm had now devolved, had applied himself with so much earnestness to his task, and things had so prospered in his hands, that the family were in a much better condition than they had ever been since their coming there.

Of all the neighbours they had come in

contact with, James Morton of Burnfoothill was the one with whom they had the most dealings. Morton's wife had been dead for many years; but his only daughter Janet, a young woman about Barbara's age, kept house for her father. At bottom, Morton was an honourable enough man, but he was grasping and worldly, and cared little for those things which his neighbour MacWilliam regarded as most sacred. Between the old folks accordingly there had been little coming and going; but Barbara and Janet were fast friends, for the two girls had forgathered among the braes shortly after the former had come to Hillfoot, and an intimacy was then formed which grew closer as they grew older, and which now rendered the two almost inseparable.

John MacWilliam had also found something of a kindred spirit in Janet, and from taking a deep interest in her welfare, he gradually awoke to the consciousness of regarding her with a true and honest affection. He had long worshipped at a distance; but now that his mother was dead, and his sister betrothed to a neighbouring swain, he determined to approach the object of his love and tell her the state of his feelings. An opportunity was not long in presenting itself. Janet came on a visit to Hillfoot one lovely June afternoon, and in the evening, as she was preparing to go home, John volunteered to accompany her. They sallied out and wended their way down the burn-side. The sun was sinking behind the hills; the sky was bright and clear and peaceful overhead, and as the shadows lengthened, a dead calm seemed to descend on all things around. Nothing was to be heard save the purling of the brook at their feet, or the bleat of the lambs far up the hillside. The quiet beauty touched the hearts of both as they tripped along, and caused them to linger by the way, that they might the longer gaze on the tranquil scene. Seating themselves on a grassy knove, with the maiden's hand clasped in his, he told in simple yet passionate language how he had long regarded her with the deepest affection and that she alone could make him happy. Need more be said? They rose to go, for the shadows were deepening; and as they sauntered down the glen hand in hand, it was agreed that he should ask her father's consent that very night.

When they entered Burnfoothill, Morton was much surprised to see John at such an unusual hour; and when he learned his errand, was not overpleased, for he had calculated that his daughter, of whom he was justly proud, would make a better match, since he was rich, and she being his only child, was the heiress-apparent to all his possessions. Accordingly, he would give his consent only on two conditions, and these were, that John should buy Hillfoot and portion it to his daughter! When John heard these conditions, his heart died within him; and he parted that night from Janet like a man in a dream; and, despairing of ever being able to fulfil the conditions, he retraced his steps up the glen with a heavier heart and less elastic step than when an hour or two before he had come down. When he reached home, he knelt by his bedside and prayed to the Father of all mercies for help to enable him to bear up with his trouble.

Throughout the long night he pondered and racked his brain for some expedient whereby he

might raise the necessary funds and remove the only obstacle between himself and his happiness, and carry Janet home in triumph—his reward and joy. The day dawned; and as he prepared to go forth to his first duty in the morning, that of looking after the sheep, he felt as if there was no life in him—as if there was nothing to live for now. But the old adage says truly—the darkest hour is just before the dawn. Seizing his staff, he stalked forth and began to ascend the hill. He had hardly reached the top when he saw right in front of him a man looking carefully amongst the heather as if for something he had lost. He appeared to be a stranger to the place; and his dress shewed him to be no shepherd; and John, surprised that such a person should be there at so early an hour, went forward and accosted him. The stranger started when he heard a voice, for he had not noticed any one approaching, but answered cheerily the 'Good-morrow' addressed to him. At first he regarded his interrogator with some suspicion; but the frank open countenance of the latter soon dispelled all doubt; and when John asked whether he had lost anything, the stranger proceeded to tell him the following story.

He began: 'I am a captain in the Scottish army; and the other day while sitting in my house in Edinburgh I received a message to come to the Tolbooth jail, as an old friend desired very particularly to see me. Wondering who this friend in the Tolbooth could be, I set out, and having arrived there you can judge of my surprise when I recognised in the prisoner before me an old comrade and fellow-officer, Bertram by name. We had served together under Leslie, and had been fast friends. After some years, Captain Bertram left his regiment and went up to London. What he went for I could never learn, but I lost sight of him from that time, until he sent for me to come to the Tolbooth. His history he told me had been an eventful one; and he had passed through much since I had seen him last. Amongst other things, he had allied himself with the ringleaders in the Ryehouse Plot; and when that conspiracy had become known to the government, my friend the captain fled with all haste from London and made the best of his way to Scotland. Though he had made many narrow escapes, he got across the Border safe enough, and was congratulating himself on having at last reached a haven of safety, when he learned to his surprise that the limbs of the law were still on his track, and that even there he was not safe. He hurried north as fast as possible, thinking to find refuge in the Highland glens; but his pursuers had been gaining on him, and as he was traversing this part of the country—I take it to be on the top of this very hill—he saw his pursuers, a party of red-coats, come over the top of yonder hill on the other side of the valley. He had carried with him from England a small box of extremely valuable jewellery, by selling which he would have as much as keep him in his old age and forced retirement. But when he saw the soldiers so close on him, he hid the box in a tuft of heather, so that if he were taken it might not fall into the hands of his enemies; and if he did escape he might have an opportunity of coming back and recovering it. He was, however, captured before he reached Glasgow, which I believe is not more than twelve miles from here; thence he was taken to Edinburgh and confined

in the Tolbooth, where I saw him. I interested myself in his case, and used all my influence to get him set free; but the evidence of his guilt was too decided to admit of a doubt, and the government was in no forgiving mood. He was tried, condemned, and has been executed. The night before his execution he sent for me and described the place where he had left his box of valuables, and asked me to go and search for them and take the use of them. From the description I got of the hill, I think this must be the one, and my errand here this morning is to find this lost treasure.'

When he had finished his story, John immediately volunteered to help him in his search for the box; and the stranger being nothing loath, the two started to look, and continued the search until the sun had mounted high in the heavens. The stranger, unused to the rough and uneven ground of the hill, was completely knocked up, and determined to give up the search as useless, remarking that it reminded him of looking for a needle in a haystack. After being pressed to go down and partake of some refreshments—which, however, the stranger declined—and as they were on the point of parting, John asked him to leave his address, so that if he did find the box, he would be able to let him know. The stranger did so, and promised a handsome reward if the box was found and brought to Edinburgh. They parted, the stranger to make the best of his way to the village, which lay some four miles off, and thence take horse to Glasgow; John to go his rounds amongst the sheep, which had been neglected while the search was going on.

Whilst he was thus occupied, he kept turning over in his mind what had passed between the stranger and himself, and it suddenly occurred to him that here was an opportunity of raising at least a little money, for should he find the box, the stranger had promised a handsome reward. At the thought, a wild tumultuous joy filled his breast, and he eagerly hastened to finish his round and get back home, so that when he had breakfasted he might renew the search. He was, however, so far behind his usual time of arrival that he found his kinsfolk in consternation at his protracted stay. Fearing some accident had befallen his son, the old man was on the point of going out to seek for him when he made his appearance. John told them the cause of his delay; and also declared his intention of going out to continue the search as soon as he had satisfied his hunger.

The story told by her brother made a great impression on Barbara, and she, after sitting wrapt in thought for a few minutes, exclaimed: 'It *must* have been him!' Her brother in surprise asked what she meant; and then she told how, one afternoon two or three months before, she had wandered up the burn-side with her seam in her hand, and had seen a man running along the hill as fast as the nature of the ground would permit; and as he ran she saw him halt, and as it were bend down amongst the heather, and then start off to run again. She stood and watched him till he went out of sight, thinking it was perhaps some poor Covenanter chased by 'Kirke's Lambs,' who at that time were the terror of the country; but having watched some time longer, and seeing no one in pursuit, she concluded it would simply be a shepherd on some errand of despatch, and

thought no more about it. Her brother's recital, however, had brought the circumstance to her memory; and laying the two things together, she inferred that it must have been Captain Bertram she had seen, and that when she saw him stoop, he had concealed the box of valuables.

When John heard his sister's story, he eagerly questioned her whether she could trace the man's course along the hill or point out the place where she had seen him stoop. Barbara was uncertain, but volunteered to accompany her brother and indicate, so far as she could remember, the spot he was so anxious to find. Hurriedly partaking of the food his sister had prepared for him, in a very few minutes the two issued forth to begin the search. They agreed that it would be better to go to the place where she had been standing when she saw the fugitive, so that she might have a better idea of where to look. They accordingly held their way up the valley, and as they were going he told her all that had passed the night before, and explained how it was that he was so eager to fall in with the concealed treasure. She, with all the ready sympathy of a sister, entered into his spirit; and when they had reached the place where she thought she had been standing, she proposed that he should go up the hill, and in that way she might be more able to tell definitely at what distance the man had been out. The suggestion seemed good, and was immediately carried out; and at the distance of nearly half a mile from where she was standing, she signalled him to stop. She immediately ascended, and as soon as she had reached him the search began in earnest. Sticking his staff in the ground where he had been standing, he hung his plaid upon it; and then Barbara and he going out something like fifty yards, and taking different directions, each described a semicircle with the plaid as centre, meeting on the opposite side. They continued the process, narrowing the circle every round, till they had come within five yards of the plaid; but all to no purpose. The task seemed hopeless, and they were on the point of abandoning the search in the spare they had inclosed with the first round, when Barbara, with a joyful cry, drew forth the box from a thick bunch of heather!

The two then hurried home to make known their good fortune to their father, and also to consult how they should let Captain Hamilton, John's friend of the morning, know that they had found the box. There were no telegraph wires in those days which could flash the news to its destination in a few minutes; nor were there even mails from so remote a place, by which letters could be carried with anything like safety or precision. The only way therefore that seemed to be advisable was that John should take the box and carry it all the way to Edinburgh and hand it over to the rightful owner. It was accordingly resolved that he should start very early next morning, which would enable him to reach Edinburgh that day, and take the box with him. To effectually conceal it, Barbara put up two pairs of blankets of her own weaving into a bundle, with the box inside; and when the east was beginning to turn gray, John set out with his bundle on his back, and some cakes and cheese in his pocket. On he trudged with a light step and lighter heart, for he felt he was on the eve of having his dearest wish fulfilled. Long before its inhabit-

ants had begun to stir, he passed through Glasgow, then an insignificant city compared with its present grandeur and prosperity. While it was still early, halting by the wayside he quenched his thirst at a neighbouring spring, and then walked on, passing many villages by the way. By mid-day he reached Falkirk, and having there done justice to his cakes and cheese, he pushed on; and as the sun was sinking in the west he reached Edinburgh, and with little difficulty sought out the address given him by his friend the captain.

He found that that gentleman lived in one of the most fashionable houses in the town; and when he knocked at the door and asked to see Captain Hamilton, the page told him in a very rough manner that his master had no time to waste on such as he. John felt nettled at this impertinence, but respectfully desired him to tell his master that the shepherd with whom he had been speaking the morning before, was at the door, and wished to see him. The page very reluctantly went; and when he delivered his message, was not a little surprised to see the alacrity with which his master obeyed the summons. The captain took John into his private room, and there eagerly asked him if he had found the box. For an answer, John quietly drew the article asked for from his bundle and handed it to the captain, who took it, and having produced the key which Bertram had given him when he told him the story, opened the box and found the contents all safe. He did not tell John what was the value of the jewels it contained; but after having been made acquainted with the mode in which the treasure had been recovered, he produced a bag containing one thousand guineas, and handed it to the faithful shepherd, as the reward of his honesty and fidelity. He at the same time pressed him to accept of his hospitality for that night; to which John readily consented, being thoroughly worn out by his long and tiresome journey. Ordering meat to be set before his guest, he waited till he had had enough, and then conducted him to a bedroom for the night.

It would hardly be possible to describe the feelings of John when he found himself alone. An overpowering sense of gratitude to his heavenly Father filled his breast, and falling on his knees, he poured forth a fervent prayer of thanksgiving for what he had received. In the munificent reward he had earned, he saw the highest aim of his ambition won, and his dearest hopes consummated. Having at length retired to rest, his thoughts kept him awake for some time; but tired Nature soon asserted herself, and he sunk into a deep and refreshing slumber, and slept until the beams of the rising sun shining into his room roused him, and warned him that it was time to be taking the road. He rose, dressed himself, and was on the point of leaving, when the butler knocked at the door and told him breakfast was laid for him in the hall. Gratefully partaking of the offered cheer, he then set forth on his journey homeward, where he arrived as the gloaming was deepening into night. His story was soon told; and when he held forth the bag of gold and declared how much it contained, and assured them that it was all his own, his sister fairly broke down and wept for very joy. John then told his father the whole story of how he had trudged to the Scottish metropolis, and what he had there found; and he in the fullness of his heart

embraced his children, and thanked God who had been so bountiful to them.

There is little more to tell. The muirland farm changed owners, and the house was repaired. James Morton was no longer opposed to the marriage of his daughter Janet with John MacWilliam, for his son-in-law elect was no longer a poor tenant farmer, but an independent laird; and before another summer had come and gone, a new mistress had begun to rule at Hillfoot, and Barbara had been wedded to her shepherd-swain. It is unnecessary to follow them further in detail; suffice it to say that John and Janet lived long and happily together, and had the pleasure of seeing their sons and daughters grow up around them; and when he died, he left Hillfoot to his eldest son, charging him neither to sell it nor to leave it. Well and faithfully has that injunction been carried out, for to this day a descendant of the MacWilliams is in possession of Hillfoot.

FIRES AND THEIR CAUSES.

THE oft-repeated words, 'Cause unknown,' appended to the daily reports of the conflagrations which occur all over the country—such as that, for instance, which lately occurred at Inveraray Castle, but which is now supposed to have been caused by lightning—furnish matter for grave reflection. A glance at the report of one of the largest fire brigades will shew us that the causes (when ascertained) are of the most varied description. It appears that the candle is the most destructive weapon to be found in an ordinary household, for conflagrations lighted by its help far outnumber those credited to any other cause. Curtains come next on the black list. The next large figures are given to 'Spark from fire,' followed by 'Foul flues.' Next in order may be noticed 'Gas,' 'Children playing with fire,' 'Tobacco-smoking,' 'Spontaneous ignition,' and lastly 'Incendiarism.'

There is no doubt that many a fire owes its origin to causes quite beyond the control of the tenant of the house in which it occurs, and that the scamping manner in which builders' work is often done is the prime cause of many a fire which is put down as unaccounted for. The ends of joists are left protruding into chimneys, or a thin hearthstone is set upon a bed of timber. In both cases the wood becomes so dry and hot that it is ready to take fire from the first spark that settles near it. Overheated flues represent a source of danger which is also attributable to the careless builder; for if the flue were so placed that its heat could not affect adjacent woodwork, it would be always as safe when hot as when cold. It is true that by act of parliament builders are obliged to preserve a certain distance between flues and timber; but surveyors cannot always reckon on their instructions being carried out, and cases are unfortunately rare nowadays where workmen will do their duty in such matters without constant supervision. Lath and plaster divisions between houses are also illegal; but buildings, and more especially warehouses, are now of such vast extent, that they really represent aggregations of small houses in which the act of parliament concerning party-walls becomes a dead-letter.

Among the ascertained causes of fire are those

which occur in the various workshops where hazardous trades are carried on. These naturally shew an increase since steam-power has become such a universal aid to nearly every kind of human labour; necessitating furnaces which remain kindled for weeks or months together. Apart from this source of risk, there are numerous trades where such inflammables as turpentine, naphtha, spirits of wine, and combinations of them in the form of varnishes, are in daily use to a very large extent. The familiarity which such constant use provokes breeds a contempt which often resolves itself into a negligence almost criminal in its nature. Drying-stoves afford another dangerous item in the list of fires connected with the trades; jappanners, cabinet-makers, and hosts of others using such stoves as a necessity of their business. Hot-water pipes for heating purposes also represent the cause of a large number of fires, the most dangerous kind being those which are charged with water and hermetically sealed. The reason of this is easily explained. Water boils at a temperature far below that necessary to ignite woodwork; but when confined in such pipes as we have described, it will rise in temperature to an extent only measured by the strength of the material which holds it. A soft metal plug is sometimes inserted in these pipes, so that should any unusual degree of heat be approached, it will melt out, and thus relieve the pressure; but such a good precaution is by no means universal.

The pipes which are used for carrying off heated air, and which are placed above gas-burners, are too often allowed to pass between the ceiling and the floor above without any regard to the obvious danger incurred. The various close stoves which were introduced to public notice at the time when the price of coal was suddenly doubled, although no doubt economical, are not so safe as the old form of kitchen range, which many a careful housewife has likened to a cavern. The whole of the air which rises through the flue of a closed stove actually passes through the fire, and thus attains a very exalted temperature. In the old stoves, on the other hand, the hot air is always largely diluted with that which is attracted to the chimney from all quarters. It is evident therefore that the chances of fire in the flue of the former are much greater than in that of the latter.

Theatres may be said to combine within their walls all the risks which we have as yet alluded to, for they represent factories where work of a most diversified kind is carried on, and where both open and closed fires are in constant use. At pantomime time especially, the number of persons employed in the various workshops of a large theatre is to the uninitiated quite marvellous. Carpenters and 'property-men' (those clever workmen who can make everything from a bunch of carrots to a parish pump) represent a constant source of danger from fire, in that they deal with inflammable material, and require the aid of heat for their size and glue. It is obviously important in a little kingdom where all is make-believe—where the most solid masonry is wood and canvas, where the greenest trees are dry as tinder, where even limpid streams are flimsy muslin, nay, where the moon itself is but a piece of oiled calico—that there should be no mistake about the reality of the precautions against accidental fire. In most theatres, rules are in force of the most stringent

character, extending even to such details as clearing so many times a day the accumulated shavings from the carpenters' shops. If such a sensible law were enforced in other places besides theatres, it would be a preventive measure of very great value.

Shavings are perhaps the most dangerously inflammable things to be found about a building. A block of wood is a difficult thing to set on fire; but when reduced to the form of shavings, a mere spark will turn it into a roaring fire. The same thing may be said in a minor degree of a lump of iron, which when reduced to filings can be burnt in the flame of a common candle. It is often this difference of bulk which will decide whether a material is practically inflammable or not. Paper affords another example of the same principle; tied tightly in bundles it may smoulder, while in loose sheets its inflammability is evident.

It is stated upon good authority that in one-third of the number of fires which occur the cause is not ascertained. The plan long ago adopted in New York, and which has led to a sensible diminution in the number of fires there, has not, for some reason, found favour with the authorities in this country. We allude to the custom of convening a coroner's court to inquire into the origin of every fire which takes place. There is little doubt that such inquiries would educate thoughtful householders into taking precautions which might not otherwise strike them as being at all necessary. The importance of such precautions is manifest when we learn that in London alone there are on the average three fires in every twenty-four hours. If this wholesale destruction were reported of an Eastern city, where the houses are of wood, and are sun-dried by incessant tropical heat, there would be some excuse for it. But here at home, where bricks and mortar are so common, it is certainly astonishing that fires should be so prevalent.

It would seem that it is a much easier task to set an entire house on fire, than it is with deliberate intention, and with proper combustibles, to light a stove for the purpose of boiling a kettle. This latter operation is not so simple as it appears to be, as any one may prove who has not already tried his, or her, hand at it. In fact, an efficient or bad house-servant may be almost at once detected by the ease or difficulty with which she lights her fires. The inefficient servant will place some crumpled paper in the grate, and will throw the best part of a bundle of wood on the top of it, crowning the whole with a smothering mass of coal; and will expect the fire to burn. The good servant will, on the other hand, first clear her grate, so as to insure a good draught; she will then place the wood above the paper, crossing the sticks again and again; then the coals are put in deftly one by one, affording interstices through which the flames will love to linger; a light is applied; and the kettle will soon be singing acknowledgments of the warm ardour with which it has been wooed. Contrast this with the other picture, where double the fuel is wasted, and where smoke and dirt make their appearance in lieu of tea and toast. We venture to say that a badly managed kitchen fire, with its train of unpunctual meals, leads to more general loss of temper than all the other minor domestic troubles put together. The stove is usually the

scapegoat on which the offending servant lays her incompetence (the cat clearly could establish an *alibi*); but the most perfect of ranges would not remedy the fault. The only real reason for such a state of things is the prevalence of sheer stupidity. Molly's mother was taught by Molly's grandmother to light a fire in a certain way, and Molly's descendants will, from persistence of habit, continue to light fires in that manner, be it good or evil, until the end of time. It is quite clear that the same stupidity which causes an intentional fire to fail, will occasionally lead to a pyrotechnic exhibition which has been quite unlooked for. For instance, cases are not unknown where servants have used the contents of a powder-horn for coaxing an obstinate fire to burn; the loss of a finger or two generally giving them sufficient hint not to repeat the experiment.

The general use of gas has done much to reduce the number of conflagrations, for it has replaced other illuminators far more dangerous; but it has at the same time contributed a cause of accident which before its use could not exist. So long as people will insist on looking for an escape of gas with a lighted candle, so long will their rashness be rewarded with an explosion. It is not customary, where there is a doubt as to whether a cask contains gunpowder or not, to insert a red-hot poker into the bung-hole. Yet such a proceeding would be scarcely less foolhardy than the detection of the presence of gas by means of flame. The test in both cases is most thorough, but it is too energetic in its action to be of any value but to those who wish to rise in the world too suddenly.

Drunkenness is a well-known source of burnt-out dwellings, the habitual tippler being too often left to his own devices in the matter of matches and candles. The usual faculty of double vision with which an inebriated man is gifted, leads to a divided claim upon the extinguisher, which naturally points to a disastrous sequel. Even sober people will be guilty of the most hazardous habits, such as novel-reading in bed with a candle placed near them on a chair; for novels, like some other graver compositions, are occasionally apt to induce slumber; and the first movement of the careless sleeper may imperil his life, as well as the lives of others who may be under the same roof with him.

The caprices of female dress have also often led to fatal accidents from fire, and crinoline skirts had in their day much to answer for. But at the present time petticoats seem to have shrunk in volume to the more moderate dimensions of an ordinary sack, so that we are not likely to hear of accidents from this particular cause until some fresh enormity is perpetrated in the name of fashion. We may mention in this connection that tungstate of soda (a cheap salt) will render muslins, &c. unflammable. But strange to say, it is not generally adopted, even on the stage, where the risks are so multiplied, because it is said to prevent the starch drying with due stiffness! We have all heard of what female courage is capable when little ones are in danger, but we hardly thought that it was equal to the task of risking precious life for the appearance of a muslin dress. We can only bow, and say—nothing.

Where fires have been traced to spontaneous combustion, it has generally been found that some

kind of decomposing vegetable matter has been the active instrument in their production. Cotton-waste which has been used for cleaning oily machinery and then thrown aside in some forgotten corner, sawdust on which vegetable oil has been spilt, and hemp, have each in its turn been convicted of incendiarism. The simple remedy is *to avoid the accumulation of lumber and rubbish in places where valuable goods and still more valuable lives are at stake.* Occasionally fires have been accidentally caused by the concentration of the sun's rays by means of a lens or of a globe of water, and opticians have for this reason to be very careful in the arrangement of their shop-windows. A case lately occurred where a fire was occasioned, it was supposed, by a carafe of water that stood on the centre of a table. The sun's rays had turned it into a burning-glass! It is stated, with what amount of truth we cannot say, that fires in tropical forests are sometimes caused by the heavy dewdrops attached to the foliage acting the part of lenses.

The advance which has been made during the last twenty years in all appliances connected with the art of extinguishing fires, has done much to limit or rather localise the dangers of such catastrophes; for whereas in the old days the lumbering 'parish squirt' was the only means of defence, we have now in all large towns steam fire-engines capable of throwing an immense stream of water with force enough to reach the topmost floors of very high buildings. The aforesaid 'squirt' was capable of little more than wetting the outside of contiguous buildings, with a view to prevent the spread of the original fire, which generally burnt itself out. But now our engines furnish a power which will often smother a large fire in the course of half an hour or less. Moreover, our well organised fire brigades are trained to convey the hose to the nucleus of the flames, and much heroism is shewn in the carrying out of this dangerous duty. It will be especially interesting to the readers of this *Journal* to note that the first really efficient brigade was formed in Edinburgh by the late lamented Superintendent Braidwood. He was afterwards employed in a like service for London, where his devotion to duty eventually cost him his life. Like a true soldier, he died 'under fire.'

And now for a few simple precautions.

Let some member of the family visit every portion of the house before it is shut up for the night. (While he is seeing to the safety of the fires and lights, he can also give an eye to bolts and bars, and thus fulfil another most necessary precaution.) See that there is no glimmering of light beneath the bedroom doors for any unreasonable time after the inmates have retired to rest. Insist on ascertaining the cause of any smell of burning. It may be only a piece of rag safely smouldering in a grate, but satisfy yourself upon the point without delay. Do not rake out a fire at night, but allow it to burn itself out in the grate. (We have already referred to the danger of hearthstones set upon timber.) Do not allow an unused fireplace to be closed up with a screen unless it is first ascertained that there is no collection of soot in the chimney, and no communication with any other flue from which a spark may come. Caution servants not to throw *hot* ashes into the dust-bin. Let the slightest escape of gas be remedied as soon as possible, and remember

that the common form of telescope gasolier requires water at certain intervals, or it will become a source of danger. Finally, forbid all kinds of petroleum and benzoline lamps to be trimmed except by daylight. (A lamp was the initial cause of the great Chicago fire.)

Many other precautions will suggest themselves to the careful housekeeper. But after all, the best precaution is common-sense, which, however, is the least available, being the misnomer for a faculty which is far from common.

A CAST OF THE NET.

THE STORY OF A DETECTIVE OFFICER.

IN FOUR CHAPTERS.—CHAPTER II.

By ten o'clock on the following morning I had sketched out my plan, and more than that, I was down at the water-side and looking after a lodging, for I never let the grass grow under my feet. I must say, however, that I very much disliked the east end of London, and especially the riverside part of it; everything was so dirty and miserable and crowded, that to a man of really decent tastes like myself, it was almost purgatory to pass a day in it. And on this particular occasion the weather changed the very day I went there; it was getting on towards late autumn (October in point of fact), and we had been having most beautiful weather; but this very morning it came on to rain, a close thick rain, and we didn't have three hours of continuous fine weather while I stopped in the east.

I was not likely to be very particular about my lodgings in one sense, though in another I was more particular than any lodger that ever came into the neighbourhood; and after a little trouble I pitched upon a public-house again, chiefly because my going in and out would attract less attention there than at a private house; so I secured a small second-floor back room at the *Anchor and Five Mermaids*, or the *Anchor* as it was generally called, for shortness.

The great recommendation of the *Anchor and Five Mermaids* was that it was nearly opposite to Byrle & Co.'s engineering shops, a ferry existing between the two places; this ferry was reached by a narrow dirty lane, which ran by the side of the *Anchor*, and I could see that numbers of the workmen came across at dinner-time. The *Anchor* stood at the corner, one front looking on the lane, the other upon the river; and once upon a time there had been, not exactly a tea-garden, but arbours or 'boxes' in front of the house, where the customers used to sit and watch the shipping; but this was all past now, and only the miserable remains of the arbours were there; and it was as dull and cheerless a place as the tavern to which Quilp took Sampson and Sally Brass in the *Old Curiosity Shop*, of which indeed it reminded me every time I looked at it.

I always had a readiness for scraping acquaintances; in fact it is not much use of your being a detective if you can't do this. If you can't be jonnick with the biggest stranger or lowest rough, you are no use on that lay. I really must avoid slang terms; but 'jonnick' means hearty and jovial; on a 'lay' means being up to some game or business. Before the first dinner-time had passed, I had got quite friendly with two or

three of Byrle's hands who came into the *Anchor* to have their beer; and I learned some particulars about the firm and then about the gatekeeper, that helped me in my ideas.

Directly after they had all gone back, I went over too, and the dinner-traffic having ceased, I was the only passenger. The ferryman did not like taking me alone, but he was bound to do it; and he looked as sulky as if he was going to be flogged at a cart's tail. He was a tall, bony-headed fellow, between fifty and sixty I should say; and I noticed him particularly because of an uncommonly ugly squint in his left eye. In accordance with my plan, I began talking cheerfully to him while he was pushing off from the shore; but he didn't answer me beyond a growl. Then I offered him some splendid chewing tobacco, which a 'friend just over from America had given me.' Really and truly I had bought it within a quarter of a mile of the *Anchor and Five Mermaids*, but he wasn't to know that. I can't chew; I hate the idea; but I put a piece of the tobacco in my mouth, knowing how fond these waterside men are of the practice, and how friendly they get with one of the same tastes. To my surprise, he would not have it, and I was glad to pitch my plug into the river when he turned his head away. But confound these cock-eyed men! there is never any knowing where to have them. He had not turned far enough, I suppose, or I didn't make proper allowances for his squint; for as I threw my plug away with a shudder—it had already turned me almost sick—I caught his plaguy cross-eye staring full at me. I knew it was, by the expression on his face; that was my only guide, for an astronomer could not have told by his eye in which direction he was looking.

The ferryman pulled well, however; and just as we got athwart the bows of a short thick-looking craft—it is of no use my trying to say what kind of a craft she was; I can't tell one from another—a voice hailed us. 'Ay, ay,' says the boatman, lifting his sculls; 'do you want to go ashore, captain?' 'Yes,' returned a voice; and I looked up and saw a man leaning over the side of the vessel; and the boatman sending his wherry close under the ship, the stranger slid down by a rope very cleverly, and got in. Though the boatman had called him 'captain,' and though he was very clever with the rope, he didn't look altogether like a regular sailor; he was a dark full-faced man, with black eyes, a dark moustache, and curly greasy-looking hair.

The stranger said a few words in a very low tone to the boatman, evidently to prevent my overhearing, and then nothing passed until we landed. The sulky ferryman took his fee without a word; and I went straight to the wicket-gate of Byrle's factory, where of course I found the gatekeeper. I stated that I was in want of employment, and had heard they were taking on labourers, and so had applied for a job.

'No; I don't know as we want any more hands,' said the man, who was sitting down in a little sentry-box; 'and we have had plenty of people here; besides, you're lame, ain't you?'

'A little,' I said, limping as I moved; 'not very bad: a kick from a horse some years ago.'

'Ah! you won't do for us then,' he said; 'but I'm sorry for you. I'm lame too, from a kick of a horse; I can't stand without my stick; here he

rose up to let me see him; 'but you see I was hurt in the service, and the firm have provided for me. I'm very sorry for you, for it's hard to be slighted because you are a cripple. Here is sixpence, old fellow, to get half a pint with, and I wish I could make it more.'

I took the sixpence, and thanked him for his kindness; he deserved my thanks, because he wasn't getting more than a pound a week, and had four or five little children. I found this out afterwards.

I was satisfied at having made a friend who might prove useful; but I had one or two more questions to ask him, and was thinking how I could best bring them in, when he said hurriedly: 'If you could get hold of Mr Byrle by himself, he might do something for you, for he is a very good sort; and you seem strong enough in every other way, and would make a good watchman, I should think.'

Yes; he did not know how good a one!

'Mr Byrle senior or junior?' I asked, on the strength of my information from the hands at the *Anchor*.

'Junior! O lor! that wouldn't do at all!' exclaimed he with quite a gasp, as if the idea took his breath away. 'It's a case of "O no, we never mention it" with him. He's seldom at home, and when he is, he and the old gentleman lead the very—Here you have it! Here's Mr Forey, the only foreman in the place who would listen to you. Now, speak up!'

Mr Forey, a dark-whiskered, stoutly built man, came up, glancing keenly at me as a stranger; so touching my cap, I again preferred my request to be taken on as a labourer.

'I don't like lame men,' he said; 'but there does not seem to be a great deal the matter with you. You say you can have a first-rate character. We shall be making changes next week, and there's no harm in your looking round on Monday morning at nine sharp.—Stop! I can give you a job now. Do you know how to get to T—?'

'Yes, sir,' I said.

'Then take this letter to Mr Byrle, and bring back an answer,' said Mr Forey. 'If he is not at home, ask for Miss Doyle, who may open it. I want an answer this afternoon; so cut off! Stay! here's a shilling for your fare; it's only tenpence, you know; and I'll leave eightpence with Bob here at the gate for your trouble.'

I took the shilling, Bob winking triumphantly at me, as if to say it was as good as done, and I left the yard.

I was amused at having the commission, for I wondered what Mr Byrle would say when he saw me, and whether my disguise was so complete that he would not recognise me at all. That would be something like a triumph, and I almost made up my mind that it would be so. Had Mr Forey seen me hurrying to the station, he might again have said that there did not seem much the matter with me; but I walked slowly enough through the street in which the *Yarmouth Smack* was situated, and had a pretty good trial of my disguise and my nerves as I passed it. Peter Tilley, dressed in a blue slop and cord trousers, so as to look like a dock labourer or something of that kind, was leaning against the door-post, lazily watching the passers-by. I made up my mind to try him; so stopping at a lamp-post just opposite to him, I took out my pipe, struck a match on the iron, coolly

lit the tobacco, and after one or two puffs, threw the match into the road and walked on. He never knew me. It was all right.

The drizzling rain came down again as I got out at T—; but luckily Mr Byrle's house was not more than a quarter of a mile from the station; and so resuming my limp, I got there without delay. The man-servant who answered the door took my letter, but told me that the old gentleman was not at home; then on finding Miss Doyle was to open the letter and send an answer, told me to wait in a little room which looked as if it was used as an office, having floor-cloth instead of carpet, wooden chairs, and so forth. He was a careful servant, and would not ask a stranger to wait in the hall, where coats and umbrellas might be had by a sharp party.

I had not waited long, when the door opened, and a young lady, whom I of course judged to be Miss Doyle, came into the room. She was a dark, keen-looking young party, and spoke rather sharply. 'You are to take an answer back, I believe?' she said.

'Yes, miss,' I answered, touching my forehead, for as you may suppose, I held my cap in my hand.

'Mr Forey only wishes me to send word; I am not to write,' she went on; 'he wants to know if Mr Byrle will be at the works to-morrow. He will not. Tell Mr Forey he will leave town to-night, and not return until the day after to-morrow. You understand?' She spoke very sharply; so I said: 'Yes, miss,' sharply too, and touched my forehead again.

'You need not wait,' she said; and opening the door, I saw the servant waiting to let me out. I knuckled my forehead again, and putting on rather a clumsier limp than before, got out of the house into the rain and mud. Rain and mud! What did I care for rain and mud now?

'Sergeant Nickham,' says I, when I got fairly out of range of her windows, for I wouldn't trust her with so much as a wink of mine—'Sergeant Nickham,' I said, 'you are the boy! If you can't command your face, there isn't a man in the force as can. If you haven't got a memory for faces, find me the man who has, that's all about it!'

Why, of all the extraordinary capers that I ever tumbled to in my life, I never came near such a caper as this. Miss Doyle! That was Miss Doyle, was it? Right enough, no doubt; but if she wasn't also the sham clerk who came and found that I was put on the watch by Mr Byrle, I didn't know a horse from a hedgehog—that's all. The quick look of her eye, her sharp quick voice, the shape of her face, the very way she stood—lor! it was all as clear as daylight. But then I thought, and I kept on thinking till I had got back to the works, what could she have to do with stealing engine-fittings? 'Twasn't likely as she had anything to do with that. It was past all question in my mind as to her being the same party. I knew it for certain; and then came the point—What did she dress herself up for and come a-spying on me and her uncle?—for she was Mr Byrle's niece.

I hadn't got to the bottom of this by any means, by the time I got back to the works; however, I gave my message very respectfully to Mr Forey; and offered Bob the gatekeeper his sixpence back, with many thanks.

'No, old chap,' he says; 'keep it at present. If you get on regular, I'll take it off you and a pint into the bargain the day you draw your first week's cash; but a fellow out of work knows the vally of a sixpence.'

The same ferryman took me back; and his temper hadn't improved, I found. I fancied too that he was particular watchful of me, and so I was particular watchful of him; and from long practice I could do it better and more secretly than he could, although he *had* got a cross-eye. Lor! I could tell when we were nearing that same ship that the man climbed out of; I could tell it by the cunning way in which the boatman looked at me, to see if I would take any special notice of it. I didn't know what his little game might be, but I determined to spoil it; so I stooped down, and was tying up my shoe, making quite a long job of it, till after we had fairly passed the craft, and then I looked up with an innocent face that quite settled him.

Just as we pushed up to the hard (that's the landing-place), he says to me: 'Do you often cross here?'

'Not often,' I said; 'at anyrate, not yet. I generally cross a little higher up.' (That was very true; about Westminster Bridge was my place; if he liked to think I meant somewhere about Tooley Street or Billingsgate, of course I couldn't help it.) 'But I have left my old quarters, and so I shall often go this way.'

'Ah,' he says, 'you live at the *Yarmouth Smack*, don't you?'

'The what?' I said. 'Where's that?'

'The *Yarmouth Smack*,' he says again, pointing to the side we had come from. I knew where the *Yarmouth Smack* was well enough; but I shook my head, and said: 'No; I live on this side of the water; but I shall live anywhere when I can get work.'

He didn't say any more; I did not suppose he would; but there was something uncommonly suspicious in his talking about the *Yarmouth Smack*, something more than I could believe came from chance.

In the lane, just as I was about to turn into the side door of the *Anchor*, I met the foreign-looking captain, who must have crossed the river before me, as I had last seen him on the other side. He knew me, I could tell well enough, and I knew him; but I was not going to let him see where I was going, so I passed the door of the *Anchor*, limping on till he was clear; then I hurried in, went upstairs at once, and was out in the old ruined arbour where I have spoken of in a minute. These overhung the river at high-water (it was nearly high-tide now), and the landing-place of the ferry was close to them. The ferryman and the captain were talking, as I expected they would be, while the boat was waiting for passengers; and by standing in the corner box, I could have heard every word they said, if they had spoken out, as honest people should speak. But they were that artful and suspicious, although they could not have known there was anybody listening, that they talked almost in whispers, and I only caught the last bit from the ferryman. 'No,' he says; 'he's not the party; but I'll go up to the *Smack* to-night and make sure of the man.'

Ah! as I thought; they were both in it somehow. But what a most extraordinary fuss and Gun-

powder Plot sort of business there was about stealing a few bits of metal. I actually should have felt ashamed of the East-enders, who are really some of the sharpest folks I ever came across, if I had not felt there was a something behind, and that, by a lucky accident, I seemed upon the point of finding it out.

The night—my first night in the east too—was not to pass without an adventure, and I had not seen the last of my new acquaintance the captain. I got very tired of the company in the *Anchor*—not that I mind who I mix with, and if there had been any of the factory hands about the place, I would have sat with them until the house closed; but they only came there at meal-times it seemed, or on their road home. So I walked about the neighbourhood a bit; not because it was pleasant, for it was a wet night; and what with the rain and the mud and the drunken sailors and the fried-fish shops and the quarrelling there was going on, it was anything but agreeable. The fact is I like to know every court and alley in my district, and there were some pretty courts and alleys here. However, nobody thought me worth robbing, and besides, I am always civil, so I never get interfered with. It's a capital rule; the best I know; and costs nothing.

When I was coming back, and had got pretty nearly to the *Anchor* and *Five Mermaids* again (it is very absurd to give such long signs to public-houses), I saw a very pretty girl whom I had noticed before, standing at a corner out of the rain; but it was not raining very much now. She wasn't—well, I won't say what she was not, or what she was. She was very pretty, I say, and was doing no harm there; but two or three fellows coming by at the moment, one of them took hold of her roughly, and finished by almost pushing her down. She got away from him, and drew a door or two off; but his companions laughing at him for being bested by a woman, he followed her, and on her pushing him from her, gave her a back-handed smack in the face. There were several men loitering about, smoking and so forth, and I heard one or two say it was a shame; but none of them interfered; and I, being a little way off, and not wanting to get into a row, might have passed this over; but she called him a brute and a coward, and he went at her to strike her again. She ran across the road to where I stood, to avoid him, and he followed her. Then I saw it was my acquaintance the captain.

He swore more horribly than ever I heard any one swear, and springing forward, would certainly have hit her down; but I jumped between them and knocked up his arm. 'Brayvo!' said some women, who had been attracted by the girl's scream; and 'Brayvo!' said the men who hadn't interfered. At once the captain turned on me, and let fly desperately at my head; but I was not to be had in that way, and I stopped him and returned a hit that I know must have loosened a couple of teeth; and then he swore again, and began to pull off his coat. So did I.

'Don't fight wid him, my darlin',' said an old Irishwoman, who was selling herrings, laying her hand on my arm. 'You're an honest English boy, and these fellows will have a knife in ye if they can't bate ye fair.'

'No, Biddy, they shan't,' said one of the men coming forward, followed by half-a-dozen more.

'If there's to be a fight, it shall be a fair one; and mates, we'll put any fellow into six feet of mud who only shews a knife.'

His mates said so too, and they were a rough and likely lot for it, and the river was within a score or so of yards. So with a scowl at them (for I do believe now he meant murder; I didn't think of it then, although I was a policeman), he rolled up his sleeves and came at me.

He was a strong fellow, not so tall perhaps, but certainly heavier than I was, and I daresay, from his manner, fancied he could fight. But fight me! Why, a gent once offered through Alec Keene (he had seen me spar in private at Alec's), to make it worth my while to leave the police, and he would back me against any ten-stone-four man I fancied, for a hundred; and I was half inclined to take it too, only something important turned up just then. Well, in two rounds I settled the captain. He tried to catch hold of me and throw me; but I knocked him clean off his legs each round; and then his friends took him away.

'There's one comfort at any rate in having had the row,' I thought: 'he'll never suppose I'm a detective after this.'

I wished, however, it had never come off, there was such a fuss. Why, if I could have drunk shillings and sixpences, I might have had them, I do believe. In a place like that you get a crowd directly; and although the affair did not last three minutes, there was a hundred men and as many women too, anxious to treat me; and I was naturally obliged to drink with one or two; not at the *Anchor* though.

The affair made such a stir, that I read in one of the local papers the next week how Jem Mace had been down in the neighbourhood of the Docks, incog.; and that for once the brute strength of a boxer had been used in a good cause, and all that sort of nonsense. I know I have always found the best class of boxers very good fellows.

Of course I was vexed at this shindy having taken place so early, as the quieter I kept myself the better; and I would have given five pounds to have been out of it. My wishing this only shews you never know what is coming; and something came out of this street fight that I never expected.

SEA-LIONS.

THE domestication of a pair of 'sea-lions' at the Brighton Aquarium, and the subsequent addition, some few months ago, of a 'little stranger' to this interesting family circle, afford an opportunity for a brief description of some of the more prominent points in the structure and habits of these little-known animals. The name 'sea-lion,' to begin with, is by no means so inappropriate or far fetched as popular designations are usually found to be, when submitted to scientific criticism. For the 'sea-lion' is included by zoologists along with the seals and walruses in the great Carnivorous order of quadrupeds, to which, it need hardly be remarked, the lions, tigers, bears, dogs, and other flesh-eaters belong. The sea-lion is in fact a large seal, and seals and walruses are simply marine bears; and if we can imagine the body of a familiar bear to be somewhat elongated, and that

the limbs were converted into swimming paddles, we should obtain a rough but essentially correct idea of the zoological position of the seals and their neighbours.

But whilst the seals and sea-lions are united with the walruses to form a special group of carnivorous quadrupeds, adapted to lead a life in the sea, there exist some very prominent points of difference between the common seals and the less familiar sea-lions. The sea-lions and their nearest allies are thus sometimes named 'Eared' seals, from the possession of an outer ear; the latter appendage being absent in the common or True seals. And whilst the common seals waddle in a most ungainly fashion on land, the sea-lions are able to 'walk,' if not elegantly, at least with a better show of comfort than their more familiar neighbours. A glance at the structure of the sea-lion's feet, or better still, a comparison of its members with those of the seal, shews the reason of its greater skill and ability in progression on the land. The fore-limbs of the seal are, so to speak buried in the skin, below the elbow; only a small part of the fore-arm and hand being thus free from the body. The hind-limbs of the seals, again, exist in a permanently extended condition, and are disposed backwards in a line with the tail and body. The hind-limbs, moreover, are frequently united with the tail by means of a connecting fold of skin, and the whole hinder extremity of the body in a seal may thus be regarded as forming a large tail-fin. In swimming, the fore-limbs of the seal are applied closely to the sides of the body, and serve as rudders; whilst the hinder portion of the body, hinder limbs, and tail, constitute the swimming-organs—a work for which by their great flexibility they are perfectly adapted.

In the sea-lions on the other hand the fore-limbs are free from the skin and body to a much greater extent than in the seals. The 'hand' itself in the sea-lion is exceedingly flexible, although completely enclosed in a horny or leathery skin. The thumbs of this hand further exist in a well developed state; all five fingers being of nearly the same length in the seal. As regards the hind-feet of the sea-lion, these members, like the fore-limbs, are freely separated from the body, at least as far as the ankle and foot are concerned, and the foot is turned outwards, forcibly reminding one of the conformation of that organ in the bear. But we may only note by way of conclusion to these zoological characters that the teeth of the sea-lion are decidedly of a carnivorous type. Any one regarding the skull of a sea-lion could readily form the idea that the animal which possessed it was a flesh-eater. These animals usually possess thirty-six teeth; the 'eye' teeth being of very large size, and so placed in the jaws that any substance entering the mouth is firmly held by these teeth and the adjoining front teeth. The 'grinders' of the sea-lion are small, and do not appear to be of any very great use to the animal. These creatures swallow their food—consisting of fishes, molluscs, and sea-birds—whole, and when

a large fish is divided in two, the portion retained in the mouth is swallowed; the portion which tumbles into the water being afterwards seized and duly swallowed in its turn.

That the sea-lions are by no means destitute of the craft and cunning of their land-neighbours, is proved by the fact that they capture such birds as the penguins by lying motionless in the water, allowing merely the tip of the nose to appear at the surface. The unwary bird, swooping down upon the floating object, presumed to consist of something eatable, is then seized and devoured by the concealed enemy.

Sea-lions may be regarded as the unknown, or at anyrate unrecognised benefactors of the fair sex, inasmuch as, from the rich *under-fur* which they possess, the favourite material known as 'seal-skin' is obtained. This latter name is entirely misleading in its nature; the much prized material being the produce of the sea-lion and not of a true seal. The possession of this valuable under-fur has contributed very largely to the causes of the indiscriminate attack which has for years past been made upon the sea-lions. The spirit of commercial enterprise has resulted in a war of extermination against these animals in certain regions, from the effects of which it is doubtful if the species can ultimately recover.

The sea-lions differ materially from the seals in their geographical distribution. The latter animals, as every casual reader of a natural history textbook knows, inhabit temperate and northern seas. The sea-lions, on the other hand, are found to be absent from all parts of the Atlantic Ocean save its most southern portions. They are common on the South American coasts, and are found inhabiting island-groups which may be regarded as belonging to the same zoological province as the latter continent. The mouth of the River Plate is stated as the most northern boundary of these animals on the eastern side of South America, whilst on the western or Pacific side of the New World they are found on the Californian coasts, and are even met with on the coasts of the Aleutian Isles and of Japan. The Pribylov Islands, included in the Alaska group, are regarded as forming the most northerly point of the sea-lions' distribution; and these islands—now in the possession of the United States—together with the Falkland Islands and the Cape of Good Hope, still form the three chief sources from which the seal-fur or seal-skin of commerce is obtained. It is also well ascertained that sea-lions occur at Kerguelen's Land, on the New Zealand coasts, on the Tasmanian shores, and the east and south coasts of Australia.

The average length of a large male sea-lion ranges from six to seven or eight feet, his weight averaging six hundred pounds. The females are of much smaller size than the males, and measure from four and a half to five feet in length; their weight being from one hundred to one hundred and fifty pounds. These animals, as might be expected, grow slowly, and attain their full dimensions the males in six, and the females in four years. The habits of these animals are not only of curious and interesting nature, but evince a decidedly high order of intelligence. The haunts of the sea-lions are, in whalers' parlance, named 'rookeries'; and in the disposition of what may be termed their domestic arrangements, as well as in the regulation of their family and personal matters, these creatures appear

to be guided by instincts which, like the social order of the ants and bees, are duly perpetuated, and have become of hereditary character. The sea-lions are migratory in habits, and disappear from the majority of the haunts and breeding-places in winter. The males are few in number as compared with the females or 'cows,' as they are termed; and each male receives under his protection a larger or smaller number of females; the oldest males possessing the largest number of dependants. In the early spring, some old males appear to return first to the haunts and do duty as reconnoitring parties; the advance-guard swimming about for several days, then landing and cautiously investigating the state of the land; their shore-visits being spent in a state of perpetual sniffing, and in the careful examination of their old haunt. About a month or six weeks after the arrival of the advance-guard, and after the inspection of the land has been duly carried out, sure signs of the coming race begin to appear in the form of hundreds of males, who select advantageous positions on the beach, and await the arrival of their partners. Nor is the period of waiting an uneventful one. The best situations on the beach are fought for with eagerness, not to say ferocity. The descriptions given of the combats of the males indicate that they are of the most sanguinary description; frequent mutilations being the results of this fight for a place on the reception-ground.

On the arrival of the females, the younger males appear to do duty as ushers, in marshalling the 'cows' to their places on the rocks and cliffs above the beach; and the work of the selection of mates by the males proceeds apace, until each happy family, consisting of a male with a dozen or fifteen cows, has been duly constituted. The progress of selection and sea-lion courtship is frequently, we regret to say, attended with disastrous consequences to the lady-members of the community. When a male, envious of the choice of his neighbour, sees an opportunity, he does not hesitate to avail himself of the chance, and not only to covet but literally to steal his neighbour's mate. The desired 'cow' is unceremoniously lifted in the mouth of the captor, and transferred with all possible expedition to his own family group. Great is the sorrow of the bereaved male; but woe to both intruder and female should the thief be discovered in the act! A fierce and sanguinary fight ensues, and the hapless, passive, and altogether innocent cause of the combat, may get dreadfully injured while the combat lasts.

The young sea-lions usually appear to be born almost immediately after the parents have landed and been allocated to their respective establishments. One young is produced at a birth; the infant sea-lion being of black colour and attaining the length of a foot. When they are four weeks old, they enter the water, and speedily become expert in swimming and diving; but it is alleged, and on good authority, that occasionally the females encounter refractory offspring, and have to exercise great patience in coaxing unwilling youngsters to enter the sea. The families have settled down to their wonted existence by the beginning of August; and we are informed that during the whole of the period which intervenes between the arrival of the females and the period last mentioned, the males have not only been most assiduous in their

attendance upon their families, but that they have also been existing independently of any nutriment. The males exemplify a case of living upon self, and appear to subsist by the reabsorption of their fatty matters; in the same fashion as the bears, which retire fat and well nourished to their winter-quarters, and appear in the succeeding spring in a lean and emaciated condition.

Regarding the sea-lions and their young at present in captivity in the Brighton Aquarium, it is interesting to note the incidents connected with the first 'bath' of baby *Otaria*. This prodigy in the way of an aquarium specimen, tumbled accidentally into the water of his tank, and apparently caused his mamma much anxiety. It is stated that he plunged voluntarily into the water on a subsequent occasion, and appeared to be perfectly at home in his native element; swimming and diving with all the dexterity of an accomplished professor of the art of natation. Being startled by some sound, the young *otaria* dived beneath the surface of the water, the mother seizing her progeny by the neck, and swimming ashore with it in her mouth. On the occasion of the writer's visit to the Brighton Aquarium, the mother and young were disporting themselves in the water; the male sitting up in the tank, and giving vent to repeated sounds, resembling exactly the hoarse bark of a dog. We may heartily re-echo the wish, that the happiness and amenity of this interesting family may be disturbed by no untoward accident, if for no other reason that they exist among us as the representatives of a most interesting and now comparatively scarce group of quadrupeds.

It has often been disputed by naturalists whether or not the sea-lions possess a mane. There can be no doubt that the old males of one species at any-rate, the *Otaria jubata* or Cook's sea-lion, the most common form on the South American coasts, possess a mane on the neck and shoulders. Nine or ten different species of sea-lions are known to zoologists, these species being distinguished from each other by very distinct variations in the form and structure of the skull, in the fur, &c. It must, however, be borne in mind, that the recognition of the exact species to which a sea-lion belongs is frequently a very difficult matter, owing to the differences perceptible in the fur of the two sexes and in the fur of either sex, at different ages.

The complaints of zoologists regarding the ill-regulated and indiscriminate slaughter of the sea-lions are, it is to be feared, as well founded as have been our own repeated remonstrances against the wholesale slaughter of seals. The United States government, however, it is satisfactory to learn, still regulate their sea-lion fisheries at the Pribylov Islands in a methodical manner. Thus the young males alone are killed, and the period during which they are taken extends from June to October; whilst the total number of sea-lions killed annually is limited. In the South Sea Islands, these animals were killed in such numbers that they are now exceedingly scarce; British and Americans alike, slaying the sea-lions without in the slightest degree discriminating between the sexes, or between young and old seals. It is to be hoped, for the sake of science as well as of commerce, that time has taught us wisdom in this respect. We have seen how necessary legislation has become to insure the prosperity of our home-fisheries; and now that the Royal Commissioners

have finished their labours in behalf of crabs and lobsters, salmon and herring, it would be well for the public interests if Mr Frank Buckland and his coadjutors were empowered to look after the sea-lion and the seal.

ANCIENT STREETS AND HOMESTEADS OF ENGLAND.

WITH kindly regard for the names, the places, and the landmarks of our forefathers, which may be called the sentimental side of our national stability, are usually, but unfortunately not invariably combined the good sense which improves but does not destroy, and the good taste which recognises the intrinsic beauty of antiquity, its harmony with our history, and the dignity which it lends to the present. Foreigners are always deeply impressed by the 'ancientness' of England, by the maintenance of the old names, and the blending together in our cities of the convenience and luxury of modern life, with the memorials of a past as grand as any country has to boast of, and marked by far less vicissitude.

Among the evidences of the stability of England to which the attention of her own students of her history and that of foreign visitors may most worthily be directed, is the minor monumental history which Mr Alfred Rimmer illustrates, and whose value and interest the Dean of Chester points out in an interesting volume entitled *Ancient Streets and Homesteads of England* (London: Macmillan & Co.); the history of the old buildings which still remain in the old streets of our old cities, in our villages and in our hamlets.

It is pleasant to ramble with Mr Rimmer from county to county of the old land, gathering as we go a great company from the past; and assuredly all will agree that no better starting-point can be found than Chester, the pride of archaeologists, the boast of historians, the city whose renown has been touched into equal brilliance and tenderness by the genius of Sir Walter Scott. An American traveller has well described the charm of the city. 'It is full,' he says, 'of that delightful element of the crooked, the accidental, the unforeseen, which, to eyes accustomed to eternal right angles and straight lines, is the striking feature of European street scenery. The Chester streets give us a perfect feast of crookedness—of those random corners, projections, and recesses, those innumerable architectural surprises and caprices and fantasies which offer such a delicious holiday to a vision nourished upon brown stone fronts.' Shrewsbury perhaps gives at first sight a more vivid picture of a fine old English town, but it has not so many treasures hidden away under modern exteriors. It is likely, Mr Rimmer tells us, that even the oldest inhabitant of Chester is ignorant of the ancient relics which the city contains. Though the origin of the famous 'Rows' is disputed—some antiquaries holding them to belong to the Roman era of the city, and to have been simply an extension of the vestibule of Roman architecture; while others consider that they were built as a refuge for the citizens during any sudden attack of the Welsh—there is but one estimate of their quaint old-world beauty; and perhaps there is no relic of the past

in all England which has more stirring memories to arouse than Chester Castle, with its Julius Caesar's tower still standing firm against the influence of time, and its tradition of Hugh Lupus Hall.

Next to the completeness of the ancient walls of Chester, its carved woodwork strikes the visitor as an instance of conservation. The carved front of the house which belonged to Randal Holme, who left valuable records of the city, is much more ancient than the date it bears (1664); and though the house called Bishop Lloyd's is now divided into tenements, the splendid remains of its ceilings and fireplaces are preserved. A little beyond it stand the beautiful cottages, with their carving intact, into which Stanley House has been divided. Here the Earl of Derby, who was executed at Bolton in 1657, passed his last day. Some of the famous carved oak furniture of this historic mansion found its way a few years ago into the possession of Mr Sly, the landlord of the celebrated *King's Arms Inn* at Lancaster, and was sold in the spring of the present year at the dispersion of his collection. One magnificent black oak bedstead splendidly carved is now in the possession of the Duke of Norfolk. Looking at the beautiful carved fronts of the cottages, and thinking of the terrible time in which the chief of the great House of Stanley left his ancestral home for ever, we are reminded of the quaint story which the earl's gentleman, Mr Bagaley, related concerning that departure. 'One Lieutenant Smith, a rude fellow,' he says, 'came in with his hat on, and told my lord he came from Colonel Duckenfield the governor, to tell his lordship he must be ready for his journey to Bolton. My lord replied: "When would have me to go?" "To-morrow, about six in the morning," said Smith. "Well," said my lord, "commend me to the governor, and tell him I shall be ready by that time." Then said Smith: "Doth your lordship know any friend or servant that would do the thing your lordship knows of? It would do well if you had a friend." My lord replied: "What do you mean—to cut off my head?" Smith said: "Yes, my lord; if you could have a friend." My lord said: "Nay, sir; if those men that would have my head will not find one to cut it off, let it stand where it is."

The Blue Posts, 'God's Providence' House, with its inscription of thanksgiving that its inmates had been spared from the plague; the beautiful gabled house in Whitefriars, with its fine mouldings and traceries, are but a few of the memorials of the past over which one lingers in Chester, before passing on to the eastern part of the county, where one finds a special treat in the old town of Congleton, which presents features of successive periods of antiquity in its still and picturesque streets, and is surrounded on all sides by venerable family seats. Mr Rimmer's drawing of the old *Lion Inn* gives a charming idea of a black-and-white gabled hostelry, with a vast porch resting on stone pillars, and supporting a room above it. The interior preserves all its old characteristics, and has a quiet ponderousness about it, as of an inn to which wayfarers came in coaches with armed outriders on horseback, with led-horses charged with baggage, or in heavy wagons. The idea of railways or smart dog-carts, or the pertness of all modern vehicles in fact, in connection with the *Lion Inn*, has a kind of impertinence about it.

Over the Cheshire border in Shropshire there is a great deal of interest for the student of the street architecture of the past; and in that county picturesque old inns abound. We find one at Ellesmere, with the grass growing in the vast courtyard, built round by the now empty stables, which were so full of life and bustle in the old coaching days. Mr Rimmer's very brief mention of Ellesmere implies that it is a much less important place than in reality it is; and all he says about Shropshire conveys an impression that he has not studied the antiquarian aspect of his subject at all so deeply as its artistic.

Two miles from Oswestry lies Whittington village, a perfect example of the solid and beautiful in village architecture, with the gateway of Peveril's Castle opening into it, and the birthplace of Sir Richard Whittington left to the choice of the visitor. Oswestry itself is an exceedingly interesting town; portions of the old wall still remain, with several stone and half-timbered houses of great antiquity; but it is seldom thoroughly explored, because the tourist is generally anxious to reach the county town of Shropshire, that famous city of Shrewsbury, which we know better perhaps through Shakspeare than through the historical chronicles of its life. The author might, however, have accorded more lengthened notice to Oswestry, which, if tradition may be relied upon, dates from the fourth century of the Christian era, and which undoubtedly derives its name from the overthrow and martyrdom of Oswald, the Christian king of Northumberland, who was vanquished there by Penda, the pagan king of Mercia.

Oswestry is stated to have been the site of a castle built in 1149 by Magod, one of the princes of Powys. It then passed, by marriage, into the hands of a Norman lord of Cher; and it was here that in 1164 Henry II. assembled the army with which he marched to Chirk, in his vain attempt to subjugate the principality. In 1277 Edward I. surrounded the town by a wall which was a mile in circumference, had four gates, and was further defended by a moat. In the thirteenth century both castle and town were destroyed by fire. Many scenes of our martial history pass before the mind's eye of the visitor to Oswestry. In 1403, Owen Glyndyr (or Glendower) marched from thence towards Shrewsbury at the head of twelve thousand men, intending there to unite his forces to those of the Earl of Northumberland and his son. Tradition, however, alleges that by the time he reached Shelton, two miles from Shrewsbury, he found the royal forces were engaged in battle with their enemy. The story of that eventful day is one out of which to make a mental picture as one contemplates the approach to Shrewsbury. Hotspur and his father had encamped on the previous night at a place called Berwick, nearly opposite Shelton, and they calculated on being joined there by Glyndyr. They sorely needed his aid; the rebel army numbered only fourteen thousand men, while that of the king numbered twenty-six thousand. In vain they waited; in vain a few unsuccessful attempts were made at a compromise, and then at a place still known as Battlefield, and in a field yet called 'the King's Croft,' the battle was joined. Before, however, the first blow was struck, Harry Hotspur called for his sword, and was informed by his

attendant that he had left it at Berwick. The iron warrior, who was about cheerfully to encounter a force greatly outnumbering his own, turned pale. 'I perceive,' he said, 'that my plough is drawing its last furrow, for a wizard told me that I should perish at Berwick, which I vainly interpreted of that town in the north.'

The Welsh chieftain climbed into the tree and beheld the conflict; at what period of the engagement is not told; but as he concluded the king would be victorious, he quietly came down again, and leaving Percy to defeat and death, marched back to his mountains. The old oak yet remains; but for the forty years during which we have known it, it has been in a failing condition. One by one its great boughs have yielded to the storm, or broken beneath their own weight; and it is now propped up with crutches and bound together with iron hoops. Probably in another half-century the place which has known it for at least six centuries will know it no more.

One of Mr Rimmer's illustrations shews us a street in Shrewsbury which may justly claim to be one of the most perfect examples of English streets yet remaining, if not the most perfect. The beautiful old gabled houses with their projecting richly carved fronts are in excellent preservation, and for a considerable distance a person walking down the middle of the street can touch them on each side; such was the economy of room in walled cities, which renders their physiognomy just the opposite to that of villages, in which the wide spaces constitute an especial beauty. Behind the city rise the Haughmond hills, clear and sharp, and wooded to their summits. Mr Rimmer tells us, that when the sun rises red over these hills, and especially if this red rising be accompanied by noise of wind, it is a certain sign of a stormy day; thus proving the truth of Shakspeare's description of how 'bloodily the sun began to peer above yon bosky hill,' upon the fatal day of the battle of Shrewsbury. Says Prince Henry to his father:

The southern wind
Doth play the trumpet to his purposes;
And by the hollow whistling in the leaves
Foretells a tempest and a blustering day.

We wish we could find in the facts a sanction for the author's statement, that in no town in England are the interesting remains, dear to the antiquary and the student, more scrupulously taken care of than in Shrewsbury; but we have before us the eloquent and pleading testimony to the contrary of Mr Ansell Day, the enthusiastic and indefatigable champion of the rights and the dignity of the old city; and on comparing his description of Shrewsbury a hundred years ago with Shrewsbury as it now is, we learn how much has been lost within a century. A hundred years ago, Shrewsbury boasted five churches of renowned beauty. The Abbey and the collegiate church of St Mary still remain, deeply interesting to the antiquary and to the visitor. But what has been the fate of the three others—of St Chad's, of St Alkmund's (so spacious, so beautiful, famous for its exquisite tower, and built by a sister of King Alfred), and of St Julian's? St Chad's requiring reparation, a country builder was employed, whose well-intentioned performance caused the tower to fall in and destroy a portion of the church. Instead of the damage being repaired, the old church was

pulled down, and an expensive, hideous, and inconvenient structure was erected in its place. The other two churches were destroyed, without even the excuse of preliminary damage; indeed so strong and in such perfect repair were they, that their demolition was an exceedingly costly process; and the buildings which replace them are curiosities of ugliness. A hundred years ago, the ancient town was surrounded by walls with square towers at intervals, alike interesting and characteristic; only a few hundred yards of the wall now remain, and one tower alone stands, the solitary memento of the past. The ancient Abbey buildings too have been swept away; the Guesten House, formerly the scene of splendid and historical hospitality; the Refectory, where a parliament once assembled to meet its king; and of all the grandeur of the past, only the ancient pulpit remains, a beautiful object indeed, but an unmeaning one in its isolation.

Wenlock, Bridgenorth, Koss, and Monmouth with its ancient massive gate, bridge, and market-place, are full of beautiful remains; and Worcester brings many a remembrance of the historic past before our minds while we gaze on Mr Rimmer's drawings of the Corn-market, Friar Street, and the Close of the beautiful cathedral, where Henry II. and his queen were crowned, and King John is buried. In old Worcester, the days of the Great Rebellion seem quite modern, and Charles II. and his unlucky brother, men of only the recent past. A beautiful and impressive drawing is that of the *New Inn*, Gloucester, that hostelry of a strange history, for it was designed to accommodate the pilgrims who used to go in crowds to the shrine raised in the Abbey Church of Gloucester over the remains of the murdered King Edward II. The vast old hostelry is enormously strong and massive, and covers an immense area. It is fully half of timber, principally chestnut-wood. Tewkesbury, Exeter, and Glastonbury are full of beautiful remains, finely rendered in this book. The Abbot's Kitchen at Glastonbury is one of the relics of the past best known in all England; here St Patrick passed the last years of his life, and here King Arthur is said to have been buried.

At Winchester are found grand examples of the domestic architecture of the fifteenth century, in addition to the superb ecclesiastical edifices of the city; Cardinal Beaufort's Tower, and St Cross, whose noble gateway, approached from the Southampton Road, is seen through great elms and walnut-trees, where the long lines of quaint high chimneys form with the church and the foliage an exquisitely picturesque combination. We pass on in the artist's company to Guildford, where the gateway of Esher Palace still remains to remind us of Wolsey's residence there after his downfall; to Salisbury, which differs from other old cities in having nothing Roman, Saxon, or Norman about it, but being purely English and unique; to Canterbury, with its wonderful wealth of antiquities, ecclesiastical, domestic, and military, all preserved with jealous care; to Rochester, with its grand and gloomy castle, and the noble cathedral, around which there hangs an atmosphere of romance; to Rye, with its ancient grass-grown streets, gabled houses, and church clock, said to be the oldest in England; to St Albans, which has just been raised by the Queen to the dignity of a city;

and from whose abbey the first books printed in England were issued ; to Banbury, with its Old Parliament House, where Cromwell's fateful parliament sat, and the *Roebuck Inn*, which contains a room accounted the most beautiful Elizabethan apartment of the early style in existence. This was Oliver's council-chamber, after the taking of Banbury Castle.

After visiting Ely, Ipswich, Norwich, Lady Jane Grey's house at Leicester, and the crumbling ruins which only remain of the Abbey, we are bidden to the Fen counties, whose picturesqueness few are aware of, though their architectural beauties, especially those of Lincolnshire, are well known ; and we are shewn among many other curious things the market-place at Oakham, all roofed and shingled with solid old oak. There is a singular custom at Oakham : every peer of the realm on first passing through the town has either to pay a fine or to present the town with a shoe from his horse ; the shoe is then nailed up on the castle gate, or in some conspicuous part of the building. Queen Elizabeth has left a memento of this nature at Oakham, as also have George IV. and Queen Victoria. These shoes are often gilt, and stamped with the name and arms of the donor.

The county of Nottingham is also amply illustrated ; and we find a drawing of the famous *Saracen's Head Inn* at Southwell, which dates from the time of Henry IV., and where Charles I. gave himself up to the Scotch commissioners. The beautiful Minster, and the splendid ruins of the palace, once the residence of the archbishops of York, and many an old house and quiet glimpse of the home-life of the long past, are to be seen at Southwell, the place which monarchs and nobles vied with each other to endow and adorn. Warwickshire is but little noticed in this book beyond the inevitable Warwick Castle and Kenilworth ; and yet how rich the land of the elm is in village, street, and homestead antiquity.

We would have welcomed further details of Coventry, that most interesting ancient city, the scene of the first days of the triumph of Henry VII., and of one term of the dreary imprisonment of Mary, Queen of Scots ; the city of the wonderful church of St Michael, which may truly be called a dream—a poem in stone. York, Beverley, Durham, Lancaster, and Carlisle, all these the artist-author sets before us with their treasures of architecture and illustration of the social life of the past. Perhaps we linger longest over the noble views of Durham Castle, and the majestic cathedral with its three grand towers, which occupies one of the finest sites in England, and with the wooded bluff beneath it, is reflected in the broad bosom of the Wear. The author leads us so far north as Carlisle, but has not much to point to there of great antiquity. The Border city had to fight too hard for ages for her mere existence, to have means or leisure for the beautifying or refining arts. Her name is otherwise writ in history.

We are grateful to Mr Rimmer for this work, which will, we hope, give the impulse to much more literature of a similar order. There is a great need of closely studied and well-written histories of the old cities and towns of the United Kingdom, which, if not conceived merely in the dry antiquarian, nor yet in the simply picturesque artistic spirit, would induce readers to recognise, and lead them to explore the archaeological treasures of

their own countries, which may be reached with ease, and might, with the assistance of books of this kind, be studied with equal pleasure and profit.

JAPANESE FANS.

DURING the past few years, Japanese fans have become so popular in this country, that a few brief remarks respecting them and the manner in which they are manufactured—culled from the published Report by Her Majesty's Consul on the trade of Hiogo and Osaka—may perhaps prove acceptable to our readers.

Osaka, we learn, is the principal city for the manufacture of the *ogi* or folding fans, which are those almost exclusively exported, all descriptions of the bamboo kind being made there ; the figures, writing, &c. required for their adornment are executed at Kioto. The prices vary from a few pence up to six pounds sterling per hundred, and occasionally even higher prices are given, though the bulk consists of the cheaper sorts. The superior kinds of fans, it may be mentioned parenthetically, which are termed *uchiwa* by the Japanese, are manufactured at Kioto, and are extensively used by the better classes of the natives.

The following are the principal features in the account which Mr Consul Annesley gives of the details connected with *ogi* or folding fans. As in many other branches of industry, the principle of division of labour is carried out in the fan-making trade. The bamboo ribs are made in Osaka and Kioto by private individuals in their own houses, and combinations of the various notches cut in the lower part are left to one of the finishing workmen, who forms the various patterns of the handle according to plans prepared by the designer. In like manner the designer gives out to the engravers the patterns which his experience teaches him will be most likely to be saleable during the ensuing season ; and when the different blocks have been cut, it still rests with him to say what colours are to be used for the two sides of each fan. In fact, this official holds, if not the best paid, at any rate the most important position on the staff in ordinary. When the printed sheets which are to form the two sides of the fans have been handed over to the workman, together with the sets of bamboo slips which are to form the ribs, his first business is to fold the two sheets of which the fan is to be composed, so that they will retain the crease, and this is done by putting them between two pieces of paper, well saturated with oil, and properly creased. The four are then folded together and placed under a heavy weight.

When sufficient time has elapsed, the sheets are taken out, and the moulds used again, the released sheets being packed up for at least twenty-four hours in their folds. The next process is to take the ribs, which are temporarily arranged in order on a wire, and 'set' them into their places on one of the sheets, after it has been spread out on a block and pasted. A dash of paste then gives the woodwork adhesive powers, and that part of the process is finished by affixing the remaining sheet of paper. The fan has to be folded up and opened three or four times before the folds take the proper shape ; and by the time

the fan is put by to dry, it has received far more handling than any foreign paper could stand; indeed foreign paper has been tried, and had to be given up, as unsuitable for the work; but with great care the Osaka fan-makers had been able to make some fans with printed pictures which had been sent over from America, though they were invariably obliged to use one face of Japanese paper.

The qualities of native paper now used are not nearly so good as those of which the old fans were made, and in consequence, the style of manufacture has had to be changed. Instead of first pasting the two faces of the fan together and then running in pointed ribs, the ribs are square and are pasted in their places in the manner described above. The outside lacquered pieces and the fancy-work are all done in Osaka and Kioto, and some of the designs in gold lacquer on bone are really artistic; but the demand for the highly ornamented description of fans is not sufficient to encourage the production of large quantities of first-class work. When the insides are dry, the riveting of the pieces together, including the outer covering, is rapidly done, and a dash of varnish quickly finishes the fan.

The highest price that was ever given for a fan in the days of seclusion from the outer world rarely exceeded a sovereign; but since the arrival of foreigners in the country, some few have been made to order at prices varying from two to three pounds sterling. The general prices of ordinary fans range from two or three shillings to three pounds per hundred, though an extraordinarily expensive fan is turned out at ten pounds per hundred. The sale of fans in olden times seldom exceeded ten thousand a year for the whole country; but in recent years no less than three millions per annum have been exported from the ports of Osaka and Yokohama alone. In concluding these brief notes, it may be interesting to mention that the number of fans ordered in Japan for the Centennial Exhibition at Philadelphia reached the large figure of eight hundred thousand, the estimated cost of which was ten thousand pounds, and that these were over and above the ordinary annual export alluded to before.

THE PIXIES.

AMONG the superstitions still far from being extirpated in Wales and some parts of Devonshire, is a belief in exceedingly small beings known as pixies. From anything we can learn, the pixies resemble the fairies of old English superstition, but with this difference, that pixies possess that love of fun and mischief which reminds us of the Puck of Shakspeare. When a pixy has been successful in any trick upon travellers, it is said to send forth a peal of laughter and to tumble head over heels to shew its delight; this has become proverbial in Devonshire; so that if any one laughs immoderately, he is said to laugh 'like a pixy.' The following pixy story is still current.

In a little country-place in the prettiest part of Devonshire there lived a miller's daughter, who was betrothed to a young farmer of the neighbourhood. For some time their course ran as smoothly as could be desired. But the young man began to cast looks of suspicion on another admirer of his betrothed, and to let a jealous

demon rankle within him, whispering to him that he no longer held the first place in the damsel's affections.

The miller's daughter, besides possessing considerable personal attractions, had the reputation of being the neatest and most industrious housewife in the place; and so the pixies, who invariably tried to aid the industrious, took her under their especial protection. They removed everything harmful from her path, and were always at hand to do her a service; she herself meanwhile being quite unconscious of the presence of the small people. One pixy used to place flowers on her window-sill every morning, and the maiden innocently dreamt that they were offerings from her lover, and prized them accordingly. One morning early about this time the young man passed before her house, and noticed the flowers upon the window-sill. Jealousy immediately took possession of him, and he saw in the simple flowers the offerings of a more favoured admirer. Just then the window was opened gently, and the miller's daughter appeared; and unconscious of the watcher lurking behind the hedge, she took up the rose-buds which formed her morning's gift and pressed them to her lips. Then she withdrew, taking the flowers with her, and leaving him to rage inwardly at what he considered her perfidy.

From that morning his behaviour towards her was changed, and he became gloomy and morose, throwing out hints of his suspicions from time to time, which troubled the gentle maiden, without her being able to comprehend any reason for it all. But the pixies, seeing how matters stood, determined to convince the moody fellow of her truth, and at the same time to punish him for his unreasonable jealousy. So one evening, when he was coming home from a market-town (perhaps top-heavy), he was pixy-led in a meadow just below the miller's house, through which he had to pass. Hosts of pixies gathered for the occasion, armed with nettles, thistles, and small bushes of thorn-trees. With these formidable weapons they pricked, stung, and mercilessly belaboured the unfortunate young man, dancing around him with mocking gestures, and chasing him from one end of the field to another.

Thus harassed, they kept him until the morning dawned, when one pixy came forward with a beautiful bunch of flowers, which he delivered to another pixy, who carried it off, and climbing up the vine that covered the side of the miller's house, laid the bouquet on the maiden's window-sill. Then he disappeared, followed quickly by the rest of the pixies, leaving the young man (who now saw from what quarter the flowers had come) to meditate on the matter. The result of his meditations was, that before another day was gone, he went to his betrothed and told her the doubts he had gone through, and the manner in which the pixies had freed him from those doubts; and the whole affair was then settled to the satisfaction of everybody concerned, including the pixies.

Stories of this sort are wonderfully poetical, and may amuse young folks, but they are two centuries out of date, and we may hope that matters are educationally in train to supersede them by materials quite as droll and a little more rational.

PRICE 1½d.

A BUNCH OF KEYS.

I AM a professional man, and reside in the West End of London. One morning some few months back, my assistant on coming to attend to his duties produced a bunch of keys, which he informed me he had just picked up at the corner of a street leading from Oxford Street.

'Hadn't they best be handed over to the police?' suggested my assistant. I wish to goodness I had at once closed with his suggestion; but I didn't, much to my own cost, as will be presently seen.

'Well, I don't know,' was my answer. 'I rather think it will be a wiser plan to advertise them, if the owner is really to have a chance of recovering them; for to my mind, articles found in that way and handed over to the police are rarely heard of again.'

An advertisement for the *Times* was duly drawn up and sent off for insertion. It merely stated where the keys had been picked up, and where the owner of the bunch could have it returned to him on giving a proper description. The next morning the advertisement appeared; and though I half expected that some applications might be made later on in the same day, it passed over quite quietly. But the following morning I had a foretaste of the trouble that awaited me so soon as the postman had deposited my letters in the box and given his accustomed knock. A glance at my table shewed me that my correspondence was very considerably beyond its average that morning. The very first letter I opened was in reference to the advertisement; and before I had gone through the collection I found there were over twenty applications for the bunch of keys in my possession. Some of the writers took the trouble to describe the keys they had lost; but none of them were in the least like those that had been picked up by my assistant. Some did not take the trouble to give any description at all, or to state if they had been in the part of the town where the keys were found; and a few boldly claimed them on the

strength of having dropped a bunch miles from the spot indicated in the advertisement!

By the time I had got through my letters and my breakfast, my servant came to tell me that my waiting-room was already full of people—'mostly ladies,' he said—though it was nearly two hours before the time I was accustomed to see any one professionally. With a foreboding that a good deal of worry and a loss of much valuable time was in store for me, I entered my consulting-room, and gave orders that the ladies should be admitted in the order of their arrival. They were all applicants for the keys; and out of the sixteen persons that were waiting, fourteen were ladies. The two gentlemen were soon despatched. They had lost keys, near the spot for anything they could tell; but on being satisfied that what had been found did in no way agree with the description of what they had lost, they apologised for the trouble and went at once.

But it was no such easy matter to get rid of my fourteen lady-applicants. Some of them were for inflicting upon me a narration of family affairs that had not the most remote connection with the business in hand. A few kept closely enough to the subject on which they had come; but would not take a denial that the keys in my possession were not the least like those they said they had lost; and it was only at the sacrifice of some of my usual politeness that I was able to get rid of them. Not one of the morning's arrival could make out anything like a fair claim, and one or two owned that they had not even been in the quarter where the keys were found on the day specified.

More letters, more applicants, came as the day wore on; and I began heartily to repent of my well-meant desire to benefit my fellow-mortals by taking the trouble to find out the rightful owner of a lost article. I was just on the point of giving orders to my servant to put off all further applicants until the following morning, when he ushered in a comfortable-looking lady of middle age, who proceeded straight to business by at once describing with the greatest accuracy the bunch of keys that had given me so much anxiety that day; and

assuring me that she had passed the spot indicated in the advertisement on the morning they were found.

'Nine keys on the bunch, all Chubb's patent; three very small ones, five of various sizes, and one latch-key longer than any of the others.'

The description was perfect. Some of the other applicants had curiously enough been right as to the number, but wrong as to description.

I at once told my lady visitor that I had no doubt the keys were hers; and that I was ready to hand them over to her. But I ventured to add that it would give me greater security were she to permit my assistant to accompany her to her residence, and there, in his presence, to open the different locks to which the keys belonged. To this proposal not the smallest objection was raised. She begged I would call my assistant, as she had a cab waiting at the door. The direction was given to some place in Bloomsbury, and they drove off. In less than an hour my assistant returned. He stated that the lady opened the street door with the latch-key, and that the other eight keys opened desks, writing-tables, cash-boxes, &c.—all quite correct and satisfactorily. The expense of the advertisement was of course paid.

Congratulating myself that this troublesome business was well over, and mentally resolving that another time, under similar circumstances, I should act on my assistant's suggestion, and hand such matters over to the police, I gave orders that all applicants that might come were to be told that the rightful owner had been found and that the keys were disposed of.

Two days passed, and I had almost dismissed the whole affair from my mind. On the morning of the third day my attention was attracted by an altercation going on between my servant and an irate lady—well advanced in years—to whom he refused admittance. Anxious to escape disturbance, I gave orders that she should be shewn into my consulting-room, where I presently went to see what she wanted.

'I want to know why you never answered my letter about the bunch of keys you advertised as having found, and which I lost? I have come for them now.'

'But, madam, none of the letters described the keys accurately, and I was therefore not bound to notice any of the written applications that reached me.'

'Not describe them properly! But I *can* describe them; they were nine in number on the bunch.'

'So far, that is right, madam. Proceed with your description.'

The description was entirely wrong; and I told her so. I told her, moreover, that the rightful owner had been found, who had not only described the keys properly, but who had taken my assistant to her house and had used each individual key in his presence. I added that if she were not satisfied, I could furnish her with the address of the lady to whom the keys had been given up, and that she might call and try to establish her claim if she fancied she had one.

She was very far from being satisfied. She wanted to argue the matter further and, as I feared, to an unreasonable length. I told her firmly I could waste no further time on her; whereupon she left vowing vengeance.

The threats of the old lady did not much disturb

me; but they were not altogether so unmeaning as I supposed, for in two days thereafter a summons was handed into me, demanding my presence at the police court of the district, to answer for my refusal to deliver up to the rightful owner property belonging to her, which I owned to having found, but refused to account for.

That I was very much annoyed may be easily supposed; but at the same time I could not help being somewhat amused, bearing in recollection how I had tried to satisfy the unreasonable dame, who had evidently more money than wit, seeing she was ready to waste it on so hopeless a case.

I duly made my appearance before the worthy magistrate, whom I happened to know slightly, and who could not restrain an amused grin when I was called forward. My assistant accompanied me as a matter of course.

The old lady had engaged a smart lawyer, who did his best in trying to make out a case; but his client rather weakened his statement by her inconsequential answers to both her counsel and the magistrate. My answer was easy. I shewed how the prosecutrix had utterly failed in describing the keys. I told that the rightful owner had rightly described them; and I put my assistant into the box to prove his having seen every key in the bunch fitted into its proper lock.

'Were you passing along Oxford Street on the morning that this bunch of keys was found?' asked the magistrate of the old lady.

'I was that way in an omnibus in the afternoon,' was the answer.

'But the keys in question were found in the morning, and were lying on the pavement,' remarked His Worship.

'Ah, I don't know how that might be,' said my persecutor; 'but I know I lost a bunch of keys.'

'Well, the case is dismissed; and you must pay expenses.' And so ended the case.

Now I have no doubt the old lady, though so wrong-headed in the claim she set up against me, had really lost a bunch of keys on the day my assistant made his—for me—unlucky find. Nor do I for a moment doubt the fact of some of the other applicants having also lost keys on the same day and perhaps near the same spot. But the applications by letter and personally numbered altogether not far short of fifty; and it may be set down as a moral certainty that they did not all lose, each of them, a bunch of keys on that particular day, and in Oxford Street—without being particular as to the spot. My theory is, that some of them had probably got their pockets picked of their keys while travelling by omnibus, and could not of course tell exactly where they lost them. Others may have simply mislaid their keys, and jumped to the conclusion that they were lost. Some others, I fear, had not lost keys at all, but merely came to my place out of idle curiosity. All of them, I know, gave me more trouble than I ever hope to have again in an affair of the kind.

[We can hardly say that the foregoing narrative, to call it so, is overstrained. It points to a marvellous want of logical precision in reasoning which is far from uncommon. Some years ago, in these pages, we mentioned a droll case within our own experience. One day we chanced to find a brooch, and advertised the fact in the newspapers.

Next day a lady called on us to say that she had lost a ring, and asked if we knew anything about it. 'Madam,' was our reply, 'you must understand that it was a brooch we found, and not a ring.' 'O yes, that may be so; but I thought as you were in the way of finding things, you might perhaps have seen something of my ring.' A very pretty example this of want of common-sense. Our advice to all who happen to find any article of value on the street is, to take it at once to the police office, where it may be reclaimed by the owner. Those who will not take this trouble, should let the article alone. Finding does not constitute ownership. We knew a gentleman, now deceased, who in the course of his life punctiliously refrained from picking up any article of value on the street, as the article was not his, and he might have been brought into trouble. This was being too fastidious, for it was allowing the article to be appropriated by possibly some dishonest person. True kindness and true honesty consist in lodging the article found, at the police office, whence, if no owner casts up within twelve months, it will be sent to the finder, whose lawful property it becomes.—Ed.]

THE LAND OF THE INCAS.

PERU recalls to every thoughtful student of history not only the half-barbaric splendour of the empire of the Incas, but the vanished prestige and glory of their Spanish conquerors. The gorgeous figure of Pizarro, the stately hidalgo, the successful captain, the ruthless soldier of fortune, meets us still at every step in the once rich Indian empire he won for Spain. On that low swampy mangrove-fringed stretch of coast, a tangled maze of vines and flowering creepers, the half-famished Castilian adventurer landed in 1524. And here, where the full tide of the Pacific rolls in upon the beach in columns of snowy foam, he, in 1535, founded Lima, the 'city of the kings.'

To examine the cities of the Incas, their ruined palaces, and other objects of note in this interesting region, was a task undertaken and carried out by Mr Squier, whose researches have been embodied in a volume entitled the *Land of the Incas*, the perusal of which enables us to offer the following items to our readers.

The coast of Peru is arid and barren, lined with guano islands, which although adding little to the charm of the scenery, are found as lucrative to-day as the mines of Potosi and Pasco were in the heyday of Spanish greatness. Thanks to this useful but unfragrant compost, Pizarro's city of the kings is still rich and flourishing, though the veins of silver are exhausted, and the golden sands no longer glitter with the precious ore, which fired the Spanish breasts of old with such fierce cupidity. It is very unhealthy, and although in the tropics, the climate for six months in the year is extremely damp and almost cold. Lima, which stands in an earthquake region, is built so as to sustain the least possible damage from the ever recurring shocks of those alarming phenomena. The private houses are never more than two stories in height. They have flat roofs and projecting balconies, and are constructed (one can hardly say built) of cane, plastered with mud, and painted in imitation of stone. Most of them have courts with open galleries in the Moorish style, extending along the

four sides; and many of them have towers, from which, in addition to the surrounding scenery, an extended view of acres of flat roofs may be obtained—the said flat roofs being piled with heaps of refuse, filth, and all manner of abominations; very often they are used as poultry-yards, and here the buzzards, which act as scavengers in all the South American cities, roost at night.

The furniture in the better class of these wicker and mud-built dwellings is often very fine: antique plate, velvet hangings, costly mirrors, and family portraits, that smile or frown upon you with all the charm or vigour the brush of Vandyke or Velasquez was able to impart. The *pasios* or public walks are planted with trees, and the arcades, which are lined with fine shops, are a very favourite promenade. The inhabitants of Lima of all grades are remarkably fond of flowers, particularly of roses, which they contrive to keep in bloom all the year round. 'Roses,' Mr Squier says, 'bloom in every court and blush on every balcony, and decorate alike the heavy tresses of the belle and the curly shock of the zamba.'

Bull-fights are a favourite amusement, and so is cock-fighting, although it is no longer, as formerly, practised in the public streets.

The markets are well supplied, especially with fruit and vegetables. Fish is good and the butchery of fair quality. The luckless traveller in Central America who could get nothing but chickens and turkeys to eat, and was afraid at last that his whiskers would transform themselves into feathers, may go to Lima with all safety, as a medium-sized turkey there costs twenty dollars in gold. The cookery is Spanish in its character, and consists much of stews savoury with oil and garlic and pungent with red pepper.

Twenty miles from Lima is Pachacamac, a sacred city of the Incas, where once stood a gigantic temple, dedicated to a deity of the same name, the supreme creator and preserver of the universe. The ruins of two large wings of this temple still remain, one of which contains a perfect well-turned arch, which is so rare a feature in American ruins that Mr Squier says 'it is the only proper arch I ever found in all my explorations in Central and South America.' Pachacamac was the Mecca of South America; and its barren hills and dry nitrous sand-heaps are filled with the dead bodies of ancient pilgrims, who travelled from all parts of the country to lay their bones, not their dust, in this hallowed spot. 'Ashes to ashes, dust to dust,' has no meaning here; the dead body does not decay, but is dried and shrivelled into a mummy. Mr Squier had the curiosity to open the shroud of what may once have been perchance an Aztec belle. The body, which was that of a young girl, was in a sitting posture, supported on a workbox of braided reeds, in which were rude specimens of knitting, spindles for weaving, spools of thread, needles of bone and bronze, a small bronze knife, a fan, and a set of curious cosmetic-boxes formed of the hollow bones of a bird. These were filled with pigments of various colours, and were carefully stopped with cotton. Beside them was a small powder-puff of cotton for applying them to the face, and a rude mirror formed of a piece of iron pyrites highly polished. There was also a netting instrument and a little crushed ornament of gold intended to represent a butterfly. The long black hair, still glossy as in life, was braided and plaited

round the forehead, which was bound with a fillet of white cloth adorned with silver spangles. A silver bracelet hung on the shrunken arm; and between the feet was the dried body of a dead parrot, a pet no doubt in life, and sacrificed to bear its mistress company into the dread unknown land of spirits.

In the fertile valley of Canete, amid rich sugar-plantations, Mr Squier found vast pyramidal buildings, rising stage upon stage, with broad flights of steps winding round them to the summits. While sketching amid a maze of these massive shattered adobe walls, our author was startled by seeing three men suddenly leap over a low wall into the vivid sunshine before him. 'God and peace be with you!' he said as calmly as he could, instinctively divining that his best cue was to appear as cool as possible. 'God and peace be with you!' responded the bandits, for such they were; and after a little bullying, an amicable parley ensued, which had for its object the acquisition of Mr Squier's breech-loading rifle, a weapon which kindled in the bosom of Rossi Arci, the robber chief, an ardent, but with all due deference to Mr Longfellow, a wasted affection, for he did not obtain it. Four weeks afterwards, Mr Squier saw the swollen disfigured corpse of this bandit captain exposed to public view in one of the principal streets of Lima.

At Truxillo our author came across a treasure-hunter, one Colonel La Rosa. This man spent his whole life in burrowing like a mole among the old ruins in search of buried gold, gems, silver goblets, or any other relic of antiquity which he could turn into money. Under his guidance, Mr Squier visited a great pyramid called the Temple of the Sun, and the extensive, interesting, and well preserved ruins of Grand Chimú. Here he found vast halls, the walls of which were covered with arabesques, and wide corridors from which spacious rooms diverged. The walls of these apartments were bright with vivid and delicate colours; and Colonel La Rosa shewed him where in the midst of them he had found a walled-up closet filled with vessels of gold and silver placed in regular layers one above the other, as if they had been hidden there in some dire emergency. Two vaults were also discovered filled with silver cups and goblets. The silver of which these vessels were composed was much alloyed with copper, and was so much oxidised that it had become exceedingly brittle. Mr Squier obtained possession of two of the cups. They have the appearance of being hammered out of a single piece of metal, are as thick as ordinary tin-plate, and are both adorned by the representation of a human face, with clearly cut features and a large aquiline nose.

About a hundred yards to the westward of the excavations which have revealed the half-buried palace of the ancient princes of Chimú, is a low broad mound, which has been found to be a necropolis, filled with bodies richly clad and covered with gold and silver ornaments. Many of the heads of the dead bodies found by Colonel La Rosa were gilt and encircled by bands of gold; and one body, that of a woman, was covered with thin sheets of gold, and wrapped in a robe spangled with silver fishes. Warlike weapons and agricultural implements, knives, war-clubs, lance-heads, and spear-points, with spades and mattocks

of different shapes, all of bronze, are found abundantly in the vicinity of these ruins; as are also specimens of excellent pottery, on which are modelled with spirit and fidelity representations of birds, animals, fishes, shells, fruit, vegetables, and the human face and form.

Leaving Chimú reluctantly, Mr Squier travelled down to the coast, along which he sailed, examining the coast ruins at Calaveras and other places, till he reached Arica, the port of Tacna.

This is peculiarly an earthquake region; and some of these subterranean convulsions are terrible to a degree which we dwellers in a temperate clime can scarcely even imagine. A notably dreadful and destructive earthquake was that of 1868, which shook to its base all the adjacent country. It was first noted in Arica about five o'clock in the morning, its premonitory symptoms being immense clouds of dust, which were seen slowly advancing across the plain in dusky columns at a distance of about ten miles.

Nearer and nearer they came; and in the awful pause of dread expectancy that ensued, the distant snowy peaks of the Cordilleras were observed to nod and reel, as if executing some horribly suggestive cyclopean dance. Gradually this impulse extended itself to the mountains nearer to the town, till the huge *morro* or headland, a little to the left of it, began to rock violently to and fro, heaving with sickening lurches, as if about to cast itself loose into space, and always bringing to again, like a hard bestead ship in a driving tempest. As it worked back and forward, huge fragments of stone detached themselves from its cave-worn surface, and fell with deafening crash into the surf below; while under and above all, like a subdued monolone of horror, was a prolonged incessant rumble, now like the roll of distant thunder, but ever and anon at irregular intervals swelling into a deafening crash, like the discharge of a whole park of artillery.

As far as could be seen, the usually solid earth was agitated by a slow wave-like motion, which became first tremulous, and then unspeakably violent, throwing half of the houses into heaps of ruins, and yawning into wide chasm-like fissures, from which mephitic sulphurous vapours issued. Shrieks and groans of anguish filled the air, a mournful interlude shrilly resounding at intervals above the subterranean thunder, as the terrified crowd rushed to the mole, to seek refuge on board the vessels in the harbour. Scarcely had they reached this hoped-for haven of safety, when the sea, treacherous as the heaving land, glided softly back, and then rushing forward with a terrific roar, submerged the mole with its panting terror-stricken occupants, and poured on in a foaming flood over the prostrate town, where it completed the havoc the earthquake had begun. It then rushed back almost more suddenly than it had advanced, the whole fearful deluge occupying only about five minutes. Again and again the earth quivered and shook, as if about to rend asunder and drop into some unfathomable abyss below, and again the sea dashed forward as if in frantic fury, and then as suddenly recoiled, the last time shewing a perpendicular wall of water forty-five feet high, capped by an angry crest of foam. This tremendous wave swept miles inshore, where it stranded the largest ships then lying in the harbour, one of them a United States frigate.

In Arica Mr Squier equipped himself for a journey over the Cordilleras. Nothing can exceed the savage wildness of these mountains, or the difficulties and dangers of the long narrow passes that intersect them. Mr Squier says: 'I have crossed the Alps by the routes of the Simplon, the Grand St Bernard, and St Gothard; but at no point on any of them have I witnessed a scene so wild and utterly desolate as that which spreads out around La Portada.' It is the very acmé of desolation—treeless, shrubless, bare of grass, with scarcely a lichen clinging to the rugged sides of the huge cliffs. Pile upon pile towering to the sullen skies, rise ridges of dark-brown hills bristling with snowy peaks, from several of which long trails of smoke stream lazily out upon the air, shewing where the pent volcano surges in ominous life beneath the wintry wastes of snow.

Descending from the Cordilleras, Mr Squier examined Tiaguanuco, the Baalbec of the New World; and from thence proceeded to Cuzco, the City of the Sun, the ancient capital of the Incas, which abounds with memorials of their vanished greatness. Here stood a magnificent temple of the sun, which was lined throughout with plates of gold, two of which, preserved as curiosities, were shewn to Mr Squier. The huge stones composing this and other massive buildings which yet remain are cut and fitted together with a precision which has been equalled, but never surpassed. So accurately do they fit, that it is impossible to pass the finest-bladed knife between their edges.

In close proximity to these splendid ruins, sometimes under their very walls, our author found rude circles of stone, such as still exist at Stonehenge and in other parts of Great Britain, and in Brittany. Bidding adieu to Cuzco and its suggestive relics, Mr Squier in his journey to the coast passed over a stupendously high swinging bridge formed of cables of braided withes. This dreadful rope-edifice swung freely in space between two gigantic cliffs, which guarded like twin sentinels the rush of the deep and rapid Apurimac, one of the head-waters of the Amazon. It was something worse than the most breakneck defile among the Cordilleras. 'Never,' says our author, 'will I forget this experience. I can see still the frail structure swaying at dizzy height over a dark abyss filled with the deep hoarse roar of the river. My eyes grew dim, my heart faint, my feet unsteady as I struggled across, not daring to cast a look on either hand.' It was no wonder that the nerves of one of the party, an artist, were so shaken that he declared that rather than set a foot upon it, he would swim across the Apurimac. This he did, and found the water so delightfully cool and pleasant, that he resolved to prolong his bath, and placed the bundle containing his clothes and shoes on a convenient cliff, whence a perverse gust of wind blew them into the water. Long he pursued them, with no result except the conviction that he had lost them irrecoverably and his way as well. In this condition, foodless, garmentless, he wandered about for three days in pathless thickets. His feet were cut and bleeding; and his body, scratched and torn, was scorched all day by a blistering sun, and so chilled at night by the cold breezes that he was glad to bury himself in the warm sand. On the fourth day he staggered, faint with fatigue and hunger, to the door of an

Indian hut, and the inhabitants mistaking him in his ghastly squalor for the incarnate genius of fever, which they dread above all things, half killed with stones what little life was left in him before they would listen to his story.

Mr Squier's researches abundantly shew that, possessing no written language, the Incas have impressed their history in characters which yet remain upon the scenes of their former glory. Their greatness may be traced in the splendid ruins of their temples and palaces. Their civilisation is abundantly proved by their bridges, roads, caravansaries, reservoirs, aqueducts, and perfect and extensive system of irrigation, by means of which vegetation was carried in terraces thousands of feet up the steep hill-sides, and the now desert coast blushed like a garden with the profuse luxuriance of the tropics. One may well ask, which were the barbarians, they or the Spaniards who soon made a Sahara of that which they found a Goshen? Their great fortresses bristling on every hill-side teach us alike the vastness of their military power and their great resources. Of their internal polity we catch a suggestive glimpse from their ample prisons; and we learn how they lived as we turn over curiously their household and agricultural implements, or mark with mute surprise the exquisitely fine texture of some mummy shroud, or the delicate carving on some long-buried goblet, or the graceful form and excellent workmanship of some fragile relic of earthenware. We can even make a guess, as we look at their burial towers and tombs, at the current of national thought on one important subject. They who laid the dead so carefully, so tenderly to rest, believed that in the far-off world of shadows the soul would live again.

A CAST OF THE NET.

THE STORY OF A DETECTIVE OFFICER.

CHAPTER III.

THERE was nothing for me to do, that I could see, for a day or two, beyond improving my acquaintance with the factory hands, and keeping my eyes open generally; and in pursuance of this latter branch of the business, I got up very early on the following morning, and sat for an hour or two after daylight in the arbours or boxes I have so often mentioned. There was one great charm about the *Anchor*. It was low and dirty, decaying and disreputable, and the landlord was a drinking fellow, utterly bankrupt and hopeless, who troubled himself about nothing. His potman was sottiſh also, and too accustomed to riff-raff and queer doings of every kind to trouble himself about me; so I was thoroughly at my ease. All I saw which appeared worthy of notice was that the ill-tempered ferryman rowed out alone to the ship I have spoken of, and disappeared round its bows. I watched for some time, but did not see him come out into mid-stream; but just before I gave up my watch, he came into sight again. Whether he had crossed after rowing up a bit and had come back, or whether he had been lying all the time just hidden by the ship, of course I could not say.

I had told the potman that I was in hope of

seeing a friend of mine who was going to Australia and had half promised to take me with him. I consequently shewed a great deal of interest in the craft, and asked him lots of questions about them. This morning I guessed that the ship (the ferryman's ship), was an Australian liner; and this was just the joke for the potman, who laughed till his beery cheeks shook again at my mistaking a slow old Dutch trader for an Australian liner. He was quite severe in his way of poking fun at me; but he ought to have pitied my ignorance, not ridiculed it—and so I told him.

I thought I would pass away the morning by going over to T— and watching Mr Byrle's house. I had learnt that he was to be from home all day; Miss Doyle had told me so herself; so I knew *she* knew it also; and if she had any suspicious visits to pay, or queer company to receive, now was the time: that was evident. Accordingly, I went to T— by rail as before, starting in the rain; but luckily, just as I got there it cleared up and the sun came out. To give me a chance of learning something, I got asking my way to a lot of places I didn't want to go to, just by way of starting a conversation, you know; and the man I pitched upon was employed in the goods shed of the railway, but did not seem to have much to do just then; and when I asked him if he could spare time to run across to the public-house with me, he said yes, he thought he could; and he did.

We could see Mr Byrle's house from this place, so it answered as well for me as any other; and while I was talking to the porter, I saw a tall young fellow, good-looking, but rather flash-looking too, go past, and in three or four minutes I saw him ring at the gate of Mr Byrle's house.

'Hollo!' I says to my railway friend, 'isn't that Sims Reeves? Does he come down here to give lessons?'

He was no more like Sims Reeves than I am, but his was the first name I could think of.

'Sims Reeves!' says the porter; 'why that's young Mr Byrle, as gives his father no end of trouble. You wouldn't see him there, only the old gent is off somewhere for a while. He went from our station last night.'

'Indeed!' I said (and then I saw the young man go into the house); 'and what's the quarrel about?'

'Oh, his goings on,' said the railway man. 'Why, I have heard that his father has paid thousands on his account; and if he hadn't paid one time pretty heavily too, this young fellow would have been in Newgate for forging his governor's name. He's agoing abroad, I believe; and a good riddance too, I say.'

'And what does he do at the house when his father is away?' I asked; and I really felt that our conversation was getting quite interesting.

'Well, it's the old story; a lady's in the case,' said the porter. 'There's a niece there that's over head and ears in love with Mr Edmund—that's his name—and he pretends to be equally sweet on her. But if she had seen only as much of him as we have seen at this here station, she would never— There's my foreman agoing into the shed! Excuse me.' With that the railway-man finished his pint and was off.

I considered a minute, and then decided I was as well off where I was as anywhere; so I borrowed yesterday's *Morning Advertiser* of the

barmaid, and sitting down where I could watch the house, pretended to read. If any one had watched me, he must have thought I was most remarkably interested in the Money Market, for I had that part of the paper folded towards me without changing for a good half-hour. At the end of that time the door of Mr Byrle's house was opened and the son came out. I was ready for a start after him, let him go in which direction he might; but he came towards the *Railway Tavern*, my post; straight on, nearer, nearer he passed my door. I peeped out after him, and saw him actually come into the tavern, entering by another door the compartment of the bar next to mine!

I was in the common place; he was in one of those divisions where 'Glasses only are served in this department;' and so on. There was some one there already, for I had heard the occasional clink of a spoon and glass, and a cough; but there wasn't more than one, for I had heard no voices. I now heard some one speak; I judged it to be young Mr Byrle, and I was right.

'Hollo, skipper!' he said, 'what have you been doing to your face? Have you been fighting?'

'Fighting!—Well, never mind my face; I don't want to talk about that; I shall settle that account some day,' said a voice. (I knew what voice; I knew what was the matter with the man's face.)

His surly tone seemed to shut young Mr Byrle up on the subject, for he gave a sort of forced laugh and said no more about it. 'When do you sail?—for certain now. I must know to an hour to-day, for I don't like what I hear of things,' said Mr Byrle.

'Don't speak so loud,' said the other; 'you can never tell who is listening;' and there he was more thoroughly right than he suspected. However, they dropped their voices so completely after this, that though I sat right up against the partition, I could hear nothing more than a stray word or so, out of which I could make no sense, until at last Mr Byrle said: 'Time's about up, skipper.'

'I suppose so,' said the other. 'Well, you feel quite confident about her then; her courage won't fail, you think?'

'Her courage fail? Ha, ha! skipper,' said Mr Byrle; 'you don't know her, or you wouldn't say that. She'll come with the material, you'll see. From first to last she's never wavered; and look what a penetrating mind she has got!'

'Yes; she's clever, I think,' says the skipper.

'Clever!' Mr Byrle repeated, with a deal of contempt in his voice—'clever! Who but her would have found out the scheme?—'

'Hush!' said the skipper, stopping the young man, just as his conversation was getting, I may say, instructive and important. Then Edmund Byrle said his train was due, and posted off to the station.

A minute or so after I heard the skipper put down his glass as though he had emptied it, and then he too left. I followed at a little distance, and got into the same train with him, and got out with him, and still following, saw him go to the ferry, pick out, as I knew he would, the surly waterman; and I saw him rowed to his own ship, where the waterman left him and then rowed over to the other side. Very good. Then the skipper had gone to T— specially to meet Edmund Byrle;

and Edmund Byrle had gone there specially because his father was away; and— Then I couldn't follow it up any further.

I went boldly into the *Yarmouth Smack*, and not seeing Tilley anywhere about, I asked for him under the agreed name, and was told he had gone to work on Byrle's wharf; not for the firm, but for some lighterman who frequented the public-house. This looked well; and if I got taken on, as I expected, the next Monday, I thought it would be very odd if between us we didn't find something out. Yet my interest in the business seemed dying away, or drifting into altogether a new channel, for I could not believe for a moment that Miss Doyle and Edmund Byrle, and the skipper and the sulky ferryman, were all linked in with stealing a few paltry brass fittings.

I crossed over before the old ferryman came back, and had my dinner in the tap-room of the *Anchor and Five Mermaids*. It wasn't a nice place for a dinner, and I was always partial to having my things neat and tidy, which was by no means the rule at the *Anchor*, and the company was not to my standard. I was late to-day, so I missed the factory hands; and there were only two men in the room with me; one was a costermongerish-looking rough in a velveteen coat and fur cap, which was about all I could see of him, for he was asleep all of a heap in a corner. The other was a man who had his dinner in a newspaper, and took it out, whatever it was, with his fingers, till he had finished it and then went away.

I was glad when he was gone, and I had the room as I may say to myself; so I sent my plate away, called for a little drop of rum-and-water (the only thing you could get fit to drink at the *Anchor*), and lighting my pipe, sat with my feet on the fender, to have a good smoke and a good hard think. I had sat there perhaps half-a-dozen minutes, and had fairly settled down to my thinking, when a low voice said: 'Mr Nickham!' My name! It was a very low voice which spoke, but the roar of an elephant couldn't have startled me more. In an instant it flashed upon me that my disguise was seen through and all my plans understood. Robinson Crusoe was not so staggered when he saw the foot-print on the sand as I was on hearing these two familiar words. I turned round, and there was that miserable-looking rough that I thought had been asleep, standing up and making signs to me. He was a regular rough and no mistake, with short hair, an ugly handkerchief twisted round his neck; his nose had been broken at some time or another, and he looked a complete jail-bird. 'Mr Nickham!'

It was he that spoke; no mistake about it this time; and he put his hand up to the side of his mouth to keep the sound straight.

'Who are you?' said I; for you know I didn't like to answer to the name at once, in case he wasn't certain.

'My name is Wilkins—Barney Wilkins,' said the man. 'But you won't recollect me by that praps; though I've been through your hands, sergeant; but I giv some other name then. You got me twelve penn'orth for ringing in shofuls.' (He meant that he had been sent to prison for twelve months for passing bad money. I wasn't surprised to hear it; he looked fit for that or anything bad. But if he got it through me, why he should speak to me now was beyond my compre-

hension.) 'I knowed you directly I see you, sergeant,' he says, coming nearer, but still speaking in the same hoarse whisper as at first; 'and though you're a tight hand, you're fair and square, and acted as such by me when you copped me. You are down here on business—you're after some rare downy cards. Now ain't you, sergeant?'

'If you know,' I said, 'what do you ask me for? And if you think I am what you say, you don't suppose I shall tell you my business, do you?'

'Sergeant,' he says, coming nearer still, 'you fought a man in the street last night, and giv him a thorough good licking. You was the only man there as would take the part of a poor gal as wasn't doing no harm to nobody; and I respect you for it, sergeant; I do. That gal was my sister—my young sister, as has been like a child to me, and was so tidy and pretty that I was proud on her, and hoped— Well, sergeant, whatever we are, we all have our feelings; and Sergeant Nickham, I'll do you a good turn. Look here!' With this he crept quite close and put his mouth almost to my ear. I watched him carefully, being much puzzled by his actions, yet I had seen such unexpected things occur in the police that I was quite ready to hear something of consequence from him. 'You are down here about that Bank paper, what is said to be all got back, but which you know it isn't. You are on the right parties, and it does you credit; but you'll never get them nor the paper without me.'

He stopped here, to see what I would say; but though I was ten times more surprised than ever, I kept my countenance, and only said: 'Well?' In point of fact I didn't know what to say.

'I've been used bad, Mr Nickham,' he went on. 'I've had a lot of trouble and risk about that there paper. I got it from B—, and took the money for it to him, honest; and have been as near took with it in my possession as anything. Twice the slops (he meant the police; 'slops' is what we call 'back-slang,' a rough sort of spelling the words backwards)—twice they have come into my place when the stuff was there. Once I was sitting upon it done up like bundles of rabbit-skins. Now he gives me (the party wot I am down on)—he gives me five pounds, and I can't get no more out of him. And you see there ain't no reward out.'

'No, not regularly, Barney,' I said; 'but there's no doubt at all that any man coming forward would be very handsomely considered by the Bank people.'

'He might be, if he'd got anybody like you to speak for him,' says Barney. 'But you know, Mr Nickham, that I am wanted for a lot of things by the bobbies; and I have been through the mill so often, that without I've got a friend I don't half like touching 'em again. But you're fair and square, and you licked the fellow last night; and I'm told you can box better than even Tom Sayers could; and if that's so, I'll trust you. And this here man won't give me more than five pounds; and he has settled with a regular fence, a sort of Dutch-Yankee skipper, what pretends to command one of them traders out there.'

'Yes, yes,' I said; 'the man I fought last night. I know him.'

'Him!' almost screeched the man (although, mind you, he never once forgot his hoarse whisper); 'was it him you licked? Sergeant Nickham, I'd go

through-fire and water for you now, for I hate and despise that wretch; and if I had got a chance to do it safely, I'd have'— He checked himself very sudden here, as if what he was going to say wasn't exactly the sort of thing to say to a detective. 'I see you are on the right lay,' he begins again; 'but I tell you he has settled with that skipper to have the stuff put on board, if it ain't already there; and then he'll go with it to whatever foreign port the craft comes from.'

'And who is he,' I asked, 'who has arranged with the skipper?'

'Ah, Mr Nickham,' says Wilkins, with a very cunning look, 'as if you didn't know! Haven't you been on the lurk round his house for two days past? Wasn't you there this morning?'

Egad! I saw it all now! You might have knocked me down with a feather. I could hardly help saying something which would have shewed my astonishment; but I choked it down, and quite determined to keep the upper hand with him, I said as cool as I could: 'Now, Wilkins, no beating about the bush, or making me help you out. If you've got anything to say, any name to mention, out with it like a man, and I'm your friend. You understand me.'

'Fair and square you are, Mr Nickham,' says Barney; 'and so you'll find me. That young Mr Byrle has got the paper, and he means to go out with the trader. There is people over in Holland awaiting anxious for it; and if once they gets hold of it, it's all U. P. with our bank-notes. Now, I don't know where the paper is; if I had known, bust me if I wouldn't have blowed the gaff long ago!'

He meant that he would have exposed the whole transaction, and I noticed that this declaration did not quite agree with his anxiety to have a friend on his side, a point on which he had dwelt so much before; but that didn't signify.

'Now, Mr Nickham,' he went on, 'you must board the craft when the paper is shipped, if it ain't there yet.'

'It ain't there yet, my man,' I said, remembering what had dropped from Edmund Byrle, that 'she would come on board with the material.'

'Then I think it will be to-night,' he continued; 'for a sail-maker as has been at work aboard her says she drops down the river to-morrow; and I think by what I can learn in other quarters, he is right.'

I thought so too, and at once made up my mind that the meeting at the *Railway Tavern* was to settle about shipping the paper.

'I can give a pretty good guess at the man they will engage for the job,' says Wilkins.

'I know him,' I said; 'a tall, sulky-looking, bony-headed old fellow, with a game eye.'

'Why, Mr Nickham,' says Wilkins, 'you're a wonder, a perfect wonder! You're a credit to the force, and Sir Richard ought to hear of it! Why, that's the man, the very man; and here have you only been down two days, and know all about it! Keep your eye on him after dark, and you're all right.'

We had some more talk after this; and then he pretended to go to sleep in his corner again, and I went out.

I went straight into the City and saw some of our chief people, who sent over to the Bank. They would not chance my going there, for fear

of somebody seeing me that had better know nothing about it. The gents from the Bank could hardly believe their ears, and the compliments they paid me, to be sure! It was decided that everything was to be left in my hands, and I was provided with letters to the right parties at the water-side. But I need not go into any further particulars of that kind.

I was not going to trouble myself any more just now about the pilfering at Byrle & Co.'s factory; as far as I was interested in it, the thieves might take boilers, wheels, chimneys, and all. I took up my post in the old harbours, and there, though the rain came steadily down, I sat. I managed to get a pretty dry corner; and with a little of the *Anchor's* rum-and-water and my pipe, I made myself tolerably comfortable while I sat and watched the Dutch trader. I was well screened from the sight of any one below, or else my corner would not have suited; and although I could hear the steps and the voices of the people going to the ferry, and could have touched them by leaning over, yet they could not see me.

The bony ferryman, in his tarpaulin coat and hat, was there this afternoon; and very sloppy and miserable all the boats looked; and as the tide fell lower and lower, the great broad bed of river-mud grew broader, and the path to the ferry-boat grew longer, and still I kept my watch, and meant to keep it. I must own, however, that I did not expect to see anything worth notice, for what could there be? But sometimes, you know, in our business, it is as necessary to watch to make sure there is nothing being done, as it is to make sure that some important movement is going on.

There was an oyster-smack not fifty yards from me as was left on the shingle or mud when the tide went down; and there was a man smoking his pipe on the deck of that oyster-smack, just as I was smoking mine in the harbour; and when night came, and the river got dark, and you couldn't make anything out of it but a great black space, with a hollow sound of the wind moaning over it and of the water lapping on the shore as the tide rose again—then there was a lantern burning on the deck of that smack, and there was a similar lantern burning in my harbour; but the light was shewn open on board of the smack, and mine was a dark-lantern (so was the other) with the light hid. But I was perfectly well aware that the man aboard that smack never took his eyes off me while it was light, and that after dark he watched to see if I shewed my lantern. I didn't shew it; but if I had, there would have been a Thames police galley and five armed constables alongside of that hard in a couple of minutes.

AN EXTRAORDINARY PROJECT.

IN the city of San Francisco resides Mr Hubert Howe Bancroft, a gentleman about forty-five years of age, formerly engaged in commerce, but now retired from business, in order that he may devote his whole life, as well as the wealth which he had amassed, to the furtherance of a project which he formed some sixteen years ago. This was no less comprehensive a task than the compilation of a full history, as well as a scientific account, of all that vast district west of the Rocky Mountains, which, stretching from Panama to Alaska, embraces Central America, Mexico, and California.

It was to be in a popular form, and to embrace every point of interest that could be ascertained respecting the Pacific States, their aboriginal inhabitants, their successive civilised occupiers, their geology, botany, and other natural features. First of all in this stupendous task comes the history of the native tribes—to be completed in five volumes, the first instalments of which are already published by Messrs Appleton and Co. in New York, and by Messrs Longmans in our own country. These will be followed by a history of the States from the Spanish Conquest down to contemporary times, and for this portion of the work it is thought that some twenty volumes will be required. A third series will treat of the geological structure of the territory, its minerals especially, and of mining operations. Physical geography forms the fourth section of the proposed work; whilst the fifth will deal with agriculture; and the sixth with bibliography. It must be apparent that a man must be of a highly sanguine temperament to imagine such an enterprise; it will be well if he live to complete only a portion of it; and should he really succeed in doing what he wishes, he will have earned for himself an honourable distinction, and conferred on the world an extraordinary boon.

But how was such an undertaking to be begun? Where were the materials; and even granting that they were to be procured, how was such a mass of general reading as must be consulted, to be utilised? Mr Bancroft's first step was to solve this difficulty. He decided to establish at his own cost, in San Francisco, a library of reference, which should contain all the books to be had for money which could throw any light on the subject. With this end in view, he appointed agents in all the principal cities of the world, whose business was to frequent sales, examine book catalogues, and effect the purchase of any volumes which seemed likely to contain useful information. Of course by such a system many books were transmitted to headquarters which ultimately proved to be of little or no value; but this was inevitable in the course of purchases of such magnitude. And notwithstanding all drawbacks of the kind, the collection has gradually increased, until it is said now to consist of between eighteen and twenty thousand volumes, including pamphlets; whether this number also includes manuscripts, we are unable to say. The acquisition of these works has been occasionally furthered by adventitious circumstances. The Mexican war, for instance, was the means of throwing in Mr Bancroft's way some highly valuable documents, which, under favourable circumstances, would have remained the property of their lawful owners; these, contained in four volumes, are a set of parchment records of the Church in Mexico between the years 1530 and 1583, and apart from their historical value, have an interest to the biblioplist as containing autographs of many celebrated men, amongst others of Philip II., Torquemada, Las Casas, and Zumarraga, first Archbishop of Mexico. This last-named worthy is notorious for his act of insensate bigotry in destroying the Aztec records, and thereby depriving the world of the history of that race; he burned the hieroglyphic paintings of Anahuac in the public square of Tlatelolco, much as Ximenes did with eighty thousand Moorish manuscripts in Granada. These priceless records were

stolen from the government archives! When the unfortunate Emperor Maximilian's library was sold, many valuable works were also obtained from that collection, which had been gathered together during a lifetime by a well-known amateur, Count Andrade.

The weakest part of the arrangement of Mr Bancroft's undertaking is the manner in which the books are housed, but this is probably an unavoidable evil; they occupy the fifth story of the owner's house in Market Street, San Francisco, where they are exposed to all the risk of fire, to say nothing of the inconvenience of such a plan. The apartment in which they are kept occupies the whole length of the building, and the books are arranged upon shelves reaching from the floor to the ceiling, and running from one end of the room to the other. Let us now see how it is proposed to utilise this mass of literature for reference.

No one but a resolute enthusiast with an abundance of means could have brought this extraordinary project into shape. The trouble spent in the undertaking has been enormous. Of course, the projector has a staff of assistants possessing the requisite accomplishments, headed by a librarian, Mr Oak, who has been indefatigable in producing a catalogue of the works collected, with copious subordinate references. So aided, Mr Bancroft, as we understand, has begun his literary operations; but whether he will live to complete his colossal production in proper artistic style must necessarily be left to conjecture. Fortunately, besides being still in middle life, he is said to have splendid bodily health and great powers of endurance, both of which must stand him in good stead. He always writes at a standing desk, and sometimes prolongs his hours of labour to as many as eleven or twelve—which seem to us excessive. Such application may do for work which is chiefly compilation; but any brain-worker knows that it is simply impossible to do really valuable work throughout such a time. As a matter of fact, very few men can read or write hard for more than six hours a day with profitable result. Let us hope, however, that the man who has had courage to undertake such a task, will have self-restraint enough not to endanger its success by an undue straining of the faculties, which must be kept in full repair to insure its accomplishment. We should be sorry to hear that any disaster from fire had put an abrupt termination to so well-meaning, though we may be allowed to call it a somewhat eccentric undertaking.

GORDON.

SHE came on towards me, her trailing draperies falling round her with the soft grace she gave to all she touched. Sunshine was on her beautiful hair—evening sunshine, which turned the wreath of plaits she wore into a crown of burnished gold. She came floating on, through the flower and fruit gemmed orange trees, through the crimson and pure white camellia bloom; violets grew beneath her feet, and she seemed to me part of the glory and the fragrance of the sunset and the blossoms.

Below the terrace where I stood, lay the sea, where blue faded to green, and green to opal, melting into one deep far-stretching mystery of purple

light and banks of golden cloud. Palaces and domes and tapering spires shone white against the dark background of distant mountains. Suddenly the music of many bells rung out on the still air, their chiming softened by distance into low faint sweetness. They were the bells of the stately marble city that shone so fair across her gleaming bay. The first bell-notes were taken up and echoed by the bells of chapels in villages along the shore; of convents hidden away in country dells and valleys, till the air was full of lingering prayerful sound. Through it, through the magical Italian twilight came the woman I loved. She came and stood beside me, looking across the water to where Genoa's palaces glimmered against the sky; but I do not think she saw or thought of them. There was a dreamy look in her eyes, a cold, set weariness about her mouth, which is only seen in those whose thoughts have drifted far from where they stand.

'Are you tired of this place?' I at length ventured to ask her.

'Not particularly,' she answered; 'you know I never care much where I am.' The words sound petulant; but said as she said them, they were only weary. I should have been glad if she had ever shewn impatience; anything rather than the cold quiet which ever lay upon her beauty like a pall. At first, in my triumphant happiness at having won her promise to be my wife, this coldness had not chilled me—as it sometimes did now—to the heart. I so longed, so hungered for a word of love, for a tender look. All her stately beauty would soon be mine, and it seemed still as far from me as ever.

We leaned on the low parapet of the terrace, while the music of the bells died away, till only the slow beating of the waves broke the stillness. It was an hour of wonderful peace and beauty, yet a strange sense of unrest took possession of me, and jarred the music of the waves and the restful quiet of the twilight. Standing there close to her, with the certainty that soon she would be my own for ever, a vague thrill of fear came over me, a fear lest all this feverish joy of knowing she was mine, might vanish away, and leave me a lonely mortal. This love for her had become to me an all-absorbing passion; and yet she never for one moment allowed me to think that my love was returned. Perhaps it was the might of her beauty that filled my senses; yet I have seen beautiful women since, and had seen them before I first saw her on the walls above the old Etruscan gateway at Perugia.

One morning the week before, I had strolled out from the dull hotel; and leaving the street with its tall houses and quaint old fountain, glowing in the day's first freshness, I sauntered on to the walls, and there I first saw her. Below in the valley the silvery olive leaves trembled in the sunshine; wreaths of broad-leaved vines clung to the gray old trees, clothing them with a borrowed beauty of youth and freshness. Hundreds of

flowers blushed in the light, and varied odours from herb and blossom filled the air with a subtle languor. Above, on the lichen-covered wall, with a background of purple mountain, a fitting frame to her stately loveliness, she sat, looking out across the sunlit land, with the dreary far-away look in her great deep eyes, and the haughty coldness upon her chiselled face. I lingered about, drinking draughts of beauty; fancying it was my artistic sense that kept me there watching her face, till she rose wearily, and slowly walking down the street, entered the hotel where I was staying.

I found on inquiry that a Mrs Vereker and her niece, Miss Mayne, had arrived there the previous evening. I had sometimes met Mrs Vereker in London; and later on in the day, while I was carelessly examining the carving on the fountain in the square I saw her and my vision of the morning standing on the cathedral steps. Mrs Vereker came forward with that friendliness we feel for a slight home acquaintance whom we may chance to meet when abroad. So I joined them, and we strolled on chatting over home news. Miss Mayne seldom spoke, and yet that walk seemed to me a strangely happy one. Mrs Vereker told me they had only been a day in Perugia, and had intended going on at once to Rome; but the mountain air and mountain views were so delightful, they had changed their minds, and intended remaining for some time at Perugia.

I had come to the old town to study art; to search the blazoned manuscripts lying hidden in sacristy and convent, and learn from them their secrets of colour and design; to wander through frescoed church and palace, where walls and ceilings are brilliant still as when the hands which wove their gorgeous stories first laid the pencil down and thanked God for the great consoler—Art. I had come to watch the mists rising from the valleys, and wrapping the mountains in soft mystery of cloud—cloud which changes and shifts, and melts at last into the golden and purple, the opaline green of the sunrise; so that I might try to wrest from Nature a faint touch of her magic of shadow and light, of colour and form, and lay it at the feet of the one mistress I had ever known—Art.

What I was now studying was a woman's heart—and what I learned was—nothing. I do not think mine is an impressionable nature. I had spent thirty years in the world, and had never loved any woman until I saw Mary Mayne in the morning light sitting above that old gateway; yet in one short week I had grown to love her—well, as few women are ever loved.

At the end of that week came a letter from Willie Vereker, saying his yacht needed some repairs, and he would put in at Genoa for a few days if his mother could meet him there. He had been to the East, and she had not seen him for some time; so she decided on going back to Genoa; hoping the *Gwendoline* might need more repairing than Willie thought, and keep him there longer than he expected. The evening of the day Mrs Vereker received that letter, I told her of my love for her niece, and asked permission to accompany them to Genoa.

She regarded me with an odd look of compassion. 'Have you spoken to Mary yet?' she asked.

I told her I had not; I wished to wait until we had known each other longer; I feared being too precipitate.

'Then,' said Mrs Vereker, 'I have no right to tell you anything of her story. It is a sad one, poor child! and I warn you, you have little chance of success. If you choose, you can come with us to Genoa; but if I were you, I should not do so. Save yourself while you can. You have known her a very short time. If you leave us now, you will soon forget her; later, you may find it a more difficult task.'

I shook my head. The advice came too late. I went with them to Genoa. The stately marble city had a charm for us all. Mrs Vereker had her son, and the two found marvellous attractions in the quaint narrow streets with their palace portals, their courts and halls, where fountains sparkled and flung diamonds of spray round the brows of pure fair statues; where in the coolness and the shadow, gold-laden orange trees and thick masses of crimson blossom gleamed with sudden startling glory.

I had my idol. Day after day I was by her side. It was a fool's Paradise perhaps; but I suppose there is such an Eden in every life; and looking back, when we have left its short-lived peace, we vainly long for a single throb of its rapture. So, during those quiet days at Genoa, each of us, except Mary Mayne, had our heart's desire: Willie, the life, the colour, the loveliness he and his *Grendoline* sought in voyages to many lands; Mrs Vereker, her son; I, my new delirious joy. There, on the terrace where we were standing, I first spoke to Mary, and heard her tell me my love was hopeless. She told me her story.

Her wedding-day had been fixed. In a year she was to have been married to a man she loved with her whole heart; when the war with Russia broke out, and Gordon Frazer's regiment was ordered to the Crimea. He and Mary wished to be married before he left, but family reasons prevented it, and so they parted. He had never returned to England. A soldier brought Mary a little locket which she had given Gordon. The ribbon it hung upon was thickened here and there with deep dark stains; and the man said Gordon Frazer had given it to him to take to Mary, when the young officer lay dying after the charge at Balaklava. It was only the story of many an English and many a Russian girl during that dreadful time. When a strong, self-contained nature breaks down, it is almost utter collapse; so it was with Mary. For months she lay silent, tearless, listlessly unable to make the slightest exertion, to take the smallest interest in life. Her friends thought her brain had suffered from the shock; and when she recovered sufficiently to travel, Mrs Vereker had taken her abroad, where they had been moving from place to place ever since. Her body regained health; she was now quite strong; but the girl's heart and soul seemed dead; as she said, dead, and buried in Gordon Frazer's grave. Yet as I listened I did not despair. I had no living rival; he was dead, this man she loved; while my heart was beating, living, and strong with its worship of her. If I could only win her to be my wife, the dead love would pale and faint before my real and passionate devotion. So I hoped, as day by day I watched her every look, forestalled her every wish, until she grew

accustomed to my presence, and to rely upon my care. My hopes were answered; ere long I won her reluctant consent to be my wife, but on the condition that our marriage should not take place until their return to England next year.

The rosy clouds were fading into the deep purple of Italian night. Silence fell around us as a mantle; only the throb of the sea below the terrace broke the intense quiet. Out on the sea shone the white sails of a little yacht. Nearer, within the harbour, rose the masts and spars of many ships, mysterious, spectre-like, as ships always look at night. As we were seated in calm enjoyment of the scene, a small boat shot out from the rocks beneath our feet, where lay some hidden cave or landing-place. It was rowed by two men; a third sat wrapped in a large cloak in the stern. They rowed well, and the boat was nearly a mile from us, leaving a bright line of light upon the shining water, when a cry broke the calm of the night—a wild, weird cry, with agony in its tone. 'Gordon!' I have never heard its like since, and I hope I never shall again. In its agonised tone I could scarcely recognise the voice of Mary, so changed was it, so shrill with long pent-up yearning, as it wailed out that one word—'Gordon!' The cry seemed to be repeated again and again, though softened by the echoes, while the little boat sped on its way, and its passengers—mere dark specks they seemed—climbed into the yacht. The white sails gleamed against the horizon, and then, phantom-like, were lost in its dim purple.

I turned and looked at Mary. She stood with her eyes fixed on the darkness which hid the yacht from sight, her hands clasped upon her heart, her face drawn and colourless. I feared the fate her friends dreaded for her had stricken her as she stood beside me there in the still luxurious twilight. 'Mary, my dearest, my own! what is it?'—taking her hand and drawing her closer.

She drew her hand from mine, and shuddering away from me, leaned against the stone parapet, resting her head on the cold marble coping.

'You are ill; let me take you home, darling,' I said.

'No,' she murmured; 'not ill. But oh,' she exclaimed, 'Harry, Harry! my good kind friend, help me! *Gordon was near us just now.* I felt it; I am sure of it. You will help me to find him; will you not?'

Help her to find him! help to break my own heart—to bruise this new-found sweetness out of my life! The very thought struck me with a sudden chill. What if this fancy of hers, coming so close upon my sure forebodings, should be a reality? What if Gordon Frazer were still in existence? I thrust the thought from me as I should thrust a temptation. 'I will help you in any way I can, my darling,' I said; 'but come in now; the night-air is chilling; and you are giving way to feverish fancies.'

'No,' she said; 'it is no fancy.' Drawing herself up wearily, she turned without looking at me; and I followed her down the terrace and across the marble court of the old palace which was our home in Genoa. I watched her glide, stately and pale and quiet, up the broad white staircase.

It was months before she recovered from the

brain-fever in which she awoke next morning—such awful months, during which we often feared the worst. Yet when they were over, and she was among us again, paler, more fragile, but still her own beautiful self, stately, self-possessed as usual, I was almost thankful for the terrible illness, which proved that her cry and wild words on the terrace were but warnings of coming illness, the mere wandering of a brain diseased.

The Roman season was nearly over, yet Rome was full—full of English sightseers, like ourselves; full of Americans, on rapid flight across Europe; of eastern prelates, in flowing eastern robes, with olive-hued eastern faces; of eager-faced French ladies, and solemn-eyed peasants from lonely villages on the Campagna, and of Italians from city and from plain; for it was Easter-time. We were only waiting until the conclusion of the festivities to set out on our journey home. Home! I never until now felt half the meaning of that word. When we got home, Mary and I would be married. I should give up wandering, and settle down into a country gentleman. I thought with a pang of self-reproach of the grand old home which called me master, shut up in desolate state since my dear father died. How a fair young mistress would brighten and beautify the old rooms. I could see it all now—the oaken hall with its quaint old pictures; spring sunshine pouring in at the open door, red-coated sportsmen grouped under the beeches, horns ringing from the copses, children playing under the shadow of the avenue of limes—the loveliness of joyous life, where for so long had been the silence left by death. It was a sunny dream of home—home in fair England, into which I had fallen; standing there, upon the Pincian, under the deep dark blue of Roman night.

Below lay the city, its narrow streets dimly mysterious, no light visible in their tall houses; the fountain murmured its sweet monotonous music in the Piazza di Spagna; the wide white marble steps gleamed along the hillside; tall palm-trees cast weird shadows across the gravelled walks; nightingales answered each other in low rich trills of song, echoing from tree to tree, through whispering palms and odorous night-flowers. Beside me, cold and silent, was the woman whose charming spell woke within me this new sweet longing for home—home musical with the soft rustling of women's garments; with the tender voices of little children. I suppose such a dream and such a longing come to all men at some time of their lives; it came to me that night as I stood above the city of vanished glories, of dead and buried dreams.

It did not last long. Suddenly, above the city roofs, a cross of silvery light shone out against the sky. The illumination of Saint Peter's had begun. Above the winding narrow streets, above palace roofs, above palm and cypress, above triumphal arch and mouldering temple, over the palace of the Cæsars, over Capitol and Forum, the silvery cross shone glad, triumphant; and from it, the light spread from window to window, from pillar to pillar, till the vast pile was one glory, changing rapidly from soft silvery radiance into a glow of golden fire.

'It was worth coming to see. Was it not, Mary?'

'Mary!' A stranger's voice echoed her name; and instead of answering my question, she sprang with a low cry from my side, and laid her head upon a stranger's breast. 'Did you not get my letters? I have been looking everywhere for you,' I heard him say.

She did not answer, nor raised her head; as if at last she had found her rest.

'You are not alone here?' he went on. 'Who are you with?'

Then with a quiver as of pain, she raised herself, and looked from me to him with beseeching eyes and trembling clasped hands.

Before she spoke—for even in all the agony of my crushed-out hopes, my love for her bore down all other feelings, and I tried to save her from the pain of telling me what I already knew—I said: 'You have found an older friend than I am, Mary. Shall I leave him to take you to Mrs Vereker?'

'An older friend?' he repeated. 'By Jove! I should think so.'

Then raising his hat, he shook hands with me as I turned away.

I turned into the darkness, but not before I had seen that until now I had never known her, my love, my promised wife. I had known a beautiful statue, not the beautiful woman who, with eyes upraised to his, stood in the subdued light looking up to Gordon Frazer. All the coldness, all the stately calm had gone, fallen from her as a mantle falls—a mantle which had hidden the fullness of her loveliness, and had concealed from me a tender grace and beauty I had never till now beheld. I have never seen her since.

Some time afterwards I met a friend who had seen a good deal of the Frazers. He was loud in admiration of Mrs Frazer's beauty and of her devotion to her husband. 'He was out in the Crimea, you know, and was reported dead; but he was only wounded. Some Russian family, to whose house he had managed to be sent, had tended him with kindly care after even his own doctors had given up hope, and had pulled him through his danger. Mrs Frazer told me,' continued my friend, 'how one evening when standing on a terrace at Genoa, she heard his voice; and thinking it was a reproach from the grave (for she was going to marry another fellow), she got brain-fever, and was near dying. The fact was, the yacht in which a friend had brought him from Constantinople touched at Genoa, and he had actually spent the day doing the palaces! When she heard his voice, he was returning to the *Peri*, which lay about two miles from the shore. Romantic story, isn't it? But Gordon takes her devotion coolly enough; the love seems more on her side than on his. I cannot understand that.'

Understand it? Yes, I could. Hers was one of those great-souled natures who like to give rather than to take, to pour out all the wealth and beauty of their being on the idol which they have clothed in all the glory of their own imaginings. God grant she may live on to the end, happy in her womanly idol-worship!

As for me, the dream I dreamt upon the Pincian Hill, before the cross of golden light shone over the city roofs, was never realised. No rustle of woman's garments makes low music in the old

oak-panelled rooms; no children's voices wake the echoes under the avenues of arching limes. The old Devon manor-house stands as yet without a mistress.

NARCOTISM.

IN these days of medical knowledge, when so many merciful means for the alleviation of pain are known, it follows as a matter of course that great abuse of sleep-producing agents exists. We would therefore say a few words of caution as to the pernicious practice of people making use of chloral, chlorodyne, chloroform, and other kindred agents *without medical advice*. It is, we think, little known to how great an extent this evil exists. To come across a lady who is constantly more or less under the influence of chlorodyne, is by no means uncommon; every trifling ailment or passing *malaise* being an excuse for a few drops of that narcotic. Chloral is also extensively and improperly used; the more so because, unfortunately at the time of its first introduction as a sleep-producing agent, it was most erroneously stated to be perfectly harmless, and many are still under this impression.

The real truth is, that *no* narcotic of any kind whatever is harmless, but on the contrary, invariably pernicious when taken otherwise than by the advice and under the treatment of a medical man. True, sleeplessness is one of the most trying things a person can suffer from; but then there are other means of combating the enemy than by dosing one's self with chloral or any such agent; and thus making an infirmity chronic, which would in all probability have been only a temporary evil. Rely upon opiates for sleep, and sleep will not come without them. Thus a bad habit is formed; the bodily strength is undermined, the digestive powers enfeebled, the mind and intellect weakened and enervated, and the unfortunate sufferer becomes a slave, bound hand and foot to a habit that it is almost impossible to shake off. Sleeplessness often comes from want of sufficient fresh air and exercise, from over-mental work, mental distress, from too great a quantity of stimulants taken during the day, and from various other causes, which a little care as to diet and regimen would quickly overcome. Taking short naps during the day; too much tea and coffee drinking, especially shortly before bedtime—all these are apt to cause sleeplessness. In many cases a light and simple supper taken shortly before retiring to rest, and attention to the feet being thoroughly warm, will insure a good night's sleep when more energetic means have failed.

In those terrible abodes of suffering, our cancer hospitals, the method of all others most resorted to, and most efficacious for the alleviation of pain, is the sub-cutaneous (under-the-skin) injection of morphia. In sciatica, neuralgia, and other painful nervous affections, this remedy is often exceedingly beneficial, when used under competent medical advice and supervision; but like every other good thing it is open to great abuse, and often made use of merely as a soothing narcotic by the irritable, excitable, and discontented. A long train of evils follows; but with these we are not called upon to deal here. What we want now to lay before the reader is a plain statement as to the prompt treatment called for in a case of over-

narcotism from too strong a dose of injected morphia. Coldness of the extremities, lividity of the countenance, profuse cold sweat, and loss of power over the limbs, insensibility, very deep breathing, and contraction of the pupils of the eyes to such an extent that they resemble a black pin-head, result.

What then is to be done? Time is precious, and perhaps half an hour or more may elapse before medical aid can be obtained. Taking it for granted that the patient is in a recumbent position, the first thing to be done is to raise the head, to sponge the face and chest copiously with fresh cold water, to rub the limbs steadily and strongly, to put hot-water applications to the feet and to the sides of the body, if it feel cold to the touch. Place strong smelling-salts to the nose; lay the head on one side with the mouth open, so that the tongue may not fall back and prevent respiration; give brandy-and-water, if the patient can possibly swallow it; but if the narcotism be severe, this will be impossible, and it is wisest to abstain from attempts which may result in fluid going the wrong way. In fact do everything to keep the body warm and the breathing unimpeded, and strive to rouse the unconscious faculties into action.

Supposing, however, that the narcotism be very excessive, and the breathing be slow, irregular, and low, then if medical aid be not forthcoming, it would be well to resort to artificial respiration; by no means a difficult matter to manage, if only any one present has a slight amount of knowledge on the subject. The following is Dr Sylvester's method, and is advantageous from its simplicity: 'Place the patient on the back, inclined a little upwards from the feet by raising and supporting the head on a cushion, placing support also under the shoulder-blades. Draw out the tongue and keep it forward, so as to leave the air-passages free. Remove all clothing from the neck, chest, and abdomen. Stand by the patient's head, take firm hold of the arms just above the elbows, and draw them gently and steadily upwards above the head, keeping them stretched upwards for two or three seconds. Then turn down the arms, and press them firmly and steadily against the sides of the chest for two or three seconds. Repeat these movements alternately, deliberately, and *perseveringly*, until a spontaneous effort at respiration is perceived; immediately upon which, proceed to try by every possible means to induce circulation and warmth.' However, should the case of narcotism be *not* a severe one, such extreme measures as artificial respiration will not be called for, and in all probability, after the use of those simpler remedies at first named, sickness will occur, and this may be taken as a sign that the worst of the evil is over.

And here let us once more emphatically state that in this and all other cases we assume that a medical man is sent for, and that our suggestions only refer to what is to be done *until* he appears upon the scene. Nothing is so annoying and so productive of harm as for a non-professional person to be constantly making this and that suggestion as to the treatment of a sufferer, when a medical man is giving his best thought and skill to the case; but on the other hand it is well for people—more especially women—to know what to do when thrown upon their own resources.

Cases, of poisoning from over-doses of opiates are of course only one class of such-like accidents; and the accidental swallowing of irritant poisons, embrocations, &c. often occur, and call for the utmost promptitude of action and presence of mind on the part of those present.

In the less densely populated parts of the country, it is a positive necessity that people should be able to rely upon themselves in cases of emergency, for if a doctor is many miles distant, and it takes several hours to fetch him, one might almost as well be without him, where sharp practice is called for. To produce vomiting, one of the best emetics we happen to know of is an American one. It consists of a table-spoonful of common treacle (molasses it is called across the water) and as much powdered alum stirred into it as the sticky compound can be made to contain. Now alum is such a valuable drug in many ways that it ought to be kept in every household medicine-chest; and treacle is not usually hard to get. We have never seen this remedy tried in a case of poisoning, but we have seen its effect in croup; and anything more decided and imperious in its action it would be difficult to imagine. Such a dose might freely be given in *any* case of poisoning; and after the emetic has acted freely, we would give some soothing mixture, such as thickened milk. There are various things which have the power to a certain extent of protecting the coats of the stomach from the action of irritant poisons; if the poison be an acid, the scrapings off a white-washed wall or chalk and milk are good. Milk almost stiffened with common brown sugar is one of them; sweet oil taken to nausea is another.

In all cases of poisoning, *loss of time* is the one great thing to be avoided; and the nearest remedy at hand is the best one to make use of. Mustard and water, strong and plenty of it, is a capital emetic. Of croup, that enemy of juvenile humanity, we must now speak a few words; and we know of no better remedy than the American one above described, combined with a hot bath and a hot blanket to roll the child well up in afterwards.

The ignorance of the poor as to the treatment and still more the prevention of the diseases of children is something appalling, and there can be no doubt that thousands of little lives are annually sacrificed to this Moloch.

'I can't tell what ails my child, ma'am,' said a labourer's wife to the writer of this, one bitter day last winter, 'he's carrying on so strange: crowing like a cock, and turning his-self almost black in the face every nows and again.'

The infant in question was comfortably seated on a nice cold door-step, and breathing as if he had swallowed a baby's rattle by mistake. 'Your child has the croup,' I said, picking up the unfortunate little creature and carrying it to the fireside; 'and if you don't do something for him at once, he'll very likely die.'

However something *was* done for him, and he didn't die; but he had a kick for his life all the same, and very little more door-step would have finished him. Yet this poor woman was not an unloving mother; she was only ignorant, and in her ignorance, assisting her child into the grave she would have shed such bitter tears over.

From croup to diphtheria is a natural progression, and we would wish to say a few, a very few words on this terrible disease; not as to its treat-

ment by the amateur nurse, for it is of the greatest importance that such cases should have close medical care. It is then on the subject of the operation called *tracheotomy*—that is, the making an outward incision in the windpipe below the seat of the disease, and inserting a tube for the purpose of respiration, that we would speak—not to discuss it in its medical aspect, but simply to say a word or two to nervous mothers who would shrink from the idea of the surgeon's knife touching a sick child under any circumstances whatever. Surely there can be no more pitiful sight to look upon than a child dying of diphtheria—the eyes wild with fear, looking appealingly for help from one troubled face to another; the little hand thrust into the mouth in helpless, useless effort to dislodge the terrible leather-like substance that is clogging up the throat, and making each breath a sound so painful that for days and weeks to come it will not cease to sound in *our* ears. What more agonising sight can the sick-room give us to gaze upon? And yet doctors have told us of cases in which a mother has had such an overpowering dread of the surgeon's knife, that even when things come to such a state as this, she has positively refused to allow of any attempt at alleviation of her child's agony by a simple operation!

Now it is on this head we wish to say a few words of encouragement and counsel. Tracheotomy is in the first place a *chance*—a very slight chance in most cases—but still a chance for life; but if it does not save life, it spares the child a death of awful suffering. The pain of the operation itself is so momentary as not to be worth considering, and relief is *instantaneous*. We are not speaking of recovery, but simply of the difference between such a death as that described above and the quiet 'falling asleep' of the child upon whom tracheotomy has been performed; and this is what the writer saw—the frightened appealing eyes; the pitiful effort at self-help; and then the instant relief given by firm and skilful hands; and four-and-twenty hours later, the quiet painless death; the boy smiling up into our faces as the pure spirit fled to that place of rest and peace where 'there shall be no more pain.' It was not a thing to be seen and forgotten.

" LIFE IN A MILITARY PRISON.

BY A PRISON CHAPLAIN.

IN an address lately delivered at Birmingham, Professor Tyndall says: 'I met some few years since in a railway carriage the governor of one of our largest prisons. He was evidently an observant and reflective man. He told me that the prisoners in his charge might be divided into three classes. The first class consisted of persons who ought never to have been in prison. External accident, and not internal taint, had brought them within the grasp of the law, and what had happened to them might happen to most of us. They were essentially men of sound moral stamina, though wearing the prison garb. Then came the largest class, formed of individuals possessing no strong bias moral or immoral, plastic to the touch of circumstances, which would mould them into either good or evil members of society. Thirdly came a class—happily not a large one—whom no kindness could conciliate and no discipline tame. They

were sent into this world labelled "Incorrigible," wickedness being stamped as it were upon their organisations.'

As a matter of fact, there is a distinction made, and rightly made, between the inmates of military prisons. They are divided into first, second, and third classes; which you may call bad, worse, and worst, if you are of the despairing type of philanthropist; or good, better, and best, if you are a great believer in human nature, even in imprisoned human nature. The first class wear a red stripe on the arm, and being the best conducted, are given less work to do and more food. Class number two are marked with a yellow stripe; while the third or lowest class are distinguished by a white badge. A stranger might perhaps shrink from all who wear white stripes as from 'incorrigibles'; but some in the third class may be really very little more 'incorrigible' than himself, for every prisoner, no matter what his character may be, except in very special cases, is placed in the third class on his reception. He then, by good conduct, becomes eligible for promotion into the second class, and subsequently into the first. Rule one hundred and sixty-six of the Regulations for Military Prisons, lays down that 'the first class will be composed of those prisoners who, from their quiet orderly habits and general good conduct under punishment, may appear deserving of being promoted from the second class after some experience has been gained of their characters. Prisoners in either the first or the second class will also be liable to be removed to a lower class for misconduct.' Though the first class of prisoners are employed during the same hours as those prescribed for the second class, the labour is of a less severe description: picking oakum or drill being substituted for the deservedly hated crank and shot exercise. Another privilege enjoyed by the first class is, that they are never deprived of their bed, whereas, 'all prisoners on reception are to sleep for the first week in the same manner as a soldier on guard—that is, on a board without undressing—and subsequently, the third-class prisoners are to sleep as on guard every other night; and the second-class prisoners in the same manner every third night: the prisoners of the first class being alone exempted from this rule.' First and second class prisoners are employed in this prison—which is no Castle of Indolence—at drill, shot exercise, the crank, cleaning the passages and other parts of the premises from six o'clock A.M. to six o'clock P.M.; and those of the third class from six o'clock A.M. to eight o'clock P.M.; with the exception of regular times for parades, chapel, and meals.

'If any man will not work neither let him eat,' is a motto strictly adhered to by the authorities; for no prisoner is allowed meat-dinner who is not employed at hard labour. Those not so engaged are only given porridge and bread-and-milk. When labouring at hard work, prisoners have a meat-dinner every Tuesday and Thursday. Eight ounces of beef without bone and one pint of soup is the allowance. The first class have an additional meat-dinner on Sundays. There is, we see, considerable advantage to be gained by the prisoner, to reward his ambition, should it prompt him to move upward into a higher class. Now this is no trifling matter, for the very essence of good prison discipline is the subordination of mere

punishment to reformation; and this system of classification tends not only to preserve a man's self-respect, but to fan the spark of hope that otherwise might be extinguished in his breast.

The justly celebrated novel *Never too late to Mend* has made the public in some degree familiar with the 'silent system' of prison discipline. This system has been found not to work when sentences are for a long period. Speech is discovered to be more than a luxury, being essential to the mental health of prisoners. None now are condemned to the silent system except those who are imprisoned for only a short time. And how great is the punishment of not being allowed to speak, is proved to the chaplain by this one fact. Nowhere are prayers so diligently responded to and hymns sung with such *will*, if without musical taste, as in the chapel of a military prison, for prisoners recognise the service as an opportunity of convincing themselves that they have not become dumb. Until this explanation was given by the governor, I was full of admiration for religion, afterwards discovered to be more loud-sounding than genuine.

Prisoners condemned to solitary confinement are forced to turn to the wall on the approach of visitors or the superior officers of the prison. 'Has my face assumed any terrific aspect? Am I so much worse-looking than usual?' This is the thought that naturally comes into one's mind on walking through a military prison for the first time. Each man takes a quick glance at your Gorgon head, and then, fast as lightning, turns his back to you and his face to the wall, until your apparently baneful or bewitching influence has passed.

Another humiliation to which prisoners have to submit is that of having their hair frequently cut short. A man must sink very low indeed before he lose altogether personal vanity. It would seem as if there were a peacock as well as an angel and a beast in each of us. For this reason the regulation that requires the hair of all prisoners of the third class to be cropped every fortnight is no slight punishment. It is especially felt by those who leave the prison without having been promoted to the second and first classes, in which a prisoner's hair is permitted to grow during the last fortnight of imprisonment. How can a man shew himself in respectable society, or take off his hat to a lady, when that common act of courtesy would reveal the fact that his hair was cut by—government?

Some may desire to know whether flogging has or has not been entirely abolished. To the question, we answer: 'Yes; except for aggravated breaches of prison discipline.' Nor is it easy to see in what other way such cases can be dealt with. A man, let us suppose in a fit of sulky stubbornness, does not attempt to pick his oakum. He is brought before the governor, and sentenced to lose his supper and bed; that is, to be obliged to sleep on the floor. On going back to his cell he says to himself: 'What can I do now to avenge myself on the authorities?' and he acts on the impulse that seizes him, which is to break the window and destroy everything in his cell. Probably this sort of stubborn ill-conditioned character is a coward; and if this be the case, nothing is found to bring him to his senses so well as twenty-five lashes

administered in the presence of the governor and medical officer.

The punishments which we should like to see abolished, if others without equal or greater disadvantages could be discovered, are the crank and shot-drill. 'What is the crank?' may be asked by happy people who have never had to do with prisons in any way. It is, we answer, a Sisyphus' wheel that the prisoner is forced to turn twelve or fourteen thousand times each day, for no other reason than because the useless monotonous exercise is sufficiently hateful to him to be a real punishment. 'To what purpose is this waste?' we may ask. Why is this wheel not made to pump water or grind corn or do some other useful work? Why should a man be degraded into a machine, and made to turn a wheel merely for the sake of turning it? Will he not in this way lose all self-respect? Yes; these are the unanswerable arguments against the crank. But then its very uselessness is urged as an argument for its retention. Suppose, for instance, that prisoners are employed in gardens where vegetables are cultivated for barrack-use, what will be the consequence? That soldiers will desire to abandon their own profession for Adam's calling, and for this purpose will designedly get into prison. If, again, the crank-wheel be utilised in any way, men will feel that they are useful members of society, and will probably prefer their new work to the dull routine and irksome duties of barrack-life. Almost the same remarks are applicable to shot-drill, or the very humiliating process of lifting six times each minute for three hours per diem a thirty-six pound cannon-ball, for no other reason than to put it down again three paces from where it originally lay. Nothing can be more fatiguing and worrying than this process of putting the shot there and back, there and back, there and back! But then we must again remark, that to make prisons very comfortable is absolutely to make them useless.

Almost all the inmates of military prisons are sentenced for such crimes as these: Desertion—the commonest crime of all—making away with kit, breaking out of barracks, insubordination. How is desertion to be stopped? This is now a very difficult problem with the authorities, and almost all officers give it as their opinion that the plague of desertion can only be stayed by again having recourse to the system lately abolished of branding the letter D on the deserter's side. In the absence of this *Nota bene*, there is nothing to prevent a soldier from enlisting over and over again in different corps, in order to get a bounty and new kit on each occasion.

As regards insubordination, when you speak to a prisoner on the folly of having resisted or disobeyed a non-commissioned officer, he will generally give an answer somewhat as follows: 'Well, sir, when I came back from foreign service I had a little money, and with this I drank with some comrades more than was good for me. There is a corporal [or sergeant] in the barrack-room who is always down on me; and upon that day, having had a little too much, I could not stand his going on at me; and so I—though indeed I tried to help myself doing so—just struck him between his eyes.' There is no doubt that nine out of every ten soldiers in military prisons have got into trouble through drink. A soldier was once overheard

describing the advantages of the Cape as a station in these words: 'Drink is cheap, and you are always dry.' Men of this stamp fill our military prisons.

In some cases the crime of insubordination is provoked by the petty bullying and offensive manner of non-commissioned officers, though their superiors do their best to check them. Officers are now easily accessible, and are ready to give the youngest private an impartial hearing. In all respects the position of a British soldier is now greatly improved. Indeed it is not too much to say that life in a military prison now is quite as endurable as was existence out of it to the well-conducted soldier of forty years ago.

DESOLATE.

LIKE a funeral pall,
Darkness lies over all;
Weirdly the owl doth call
From her lone steep.
Sadly the night-wind blows
Over December snows;
Vain 'tis my eyes to close—
I cannot sleep.

Thy voice is in my ear;
Once more thy words I hear,
Bringing now hope now fear,
But always love;
And thy sweet face doth rise
Radiant with starry eyes,
Cloudless as summer skies
In heaven above.

Once more at night's soft noon,
Under the pensive moon
Of a long vanished June,
With thee I stray:
As when in days of old
All my heart's love I told,
And to my pleading bold
Thou saidst not nay.

When thou wast by my side,
Calmly the days did glide;
Like an unruffled tide
My life did flow.
Then was each hour too brief;
Now I but seek relief
From my consuming grief,
Rest from my woe.

Now falls the scalding tear,
Shed for the present dear;
Shed for the past so dear,
So quickly flown.
Over thy lonely grave,
Hard by the sounding wave,
Madly the wind-gusts rave;
I am alone.

Yes; but my whole life through
Leal have I been and true;
True shall I be to you,
As true as then;
Till when that life is o'er,
Skyward my soul shall soar,
And on the heavenly shore
We meet again.

CHRISTMAS-TIME.

'So many men so many minds' has been a proverb long before our days, and will be to the end of time and human history; and uniformity of sentiment is the one thing which men need never hope to attain.

Christmas-time is one of these battle-fields of feeling. To some it is just the consecration of so many circumstances of torture; to others the meeting-point of so many facts of pleasure. From the conventional greeting to the orthodox dinner — from the 'seasonable gifts' that are more obligatory than voluntary, to the toast that heralds the punch, and the dreams that follow on that last glass—all is so much pain to the flesh and weariness to the spirit; and they wonder how any one can find it otherwise. What is there in Christmas-time to make it pleasurable? they say. The gathering together of the family? A lot of rough boys home from school, who spoil the furniture and tease the dogs, lame the horses and ravage the garden, make the servants cross, the girls rude, and the younger children insubordinate; who upset all the order of the house, destroy its comfort like its quiet, and to whose safe return to discipline and your own restoration to tranquillity you look forward with impatient longing from the first hour of their arrival to the last of their stay? Or the advent of your married daughter with her two spoiled babies, who cry if they are looked at and want everything that they see, and that very objectionable young man her husband, with his ultra opinions and passion for argument, whom she would marry in spite of all that you could say, but to whom you can scarcely force yourself to be decently civil, not to speak of cordial, and whose presence is a perpetual blister while it lasts? Is this the family gathering about which you are expected to gush?—this with the addition of your son's fine-lady wife who snubs his mother and sisters with as little breeding as reserve, finds nothing at your table that she can eat, lives with her smelling-bottle to her nose and propped up with cushions on the sofa, and gives

you to understand that she considers herself humiliated by her association with your family, and your son as much exalted as she is degraded? This is the domestic aspect of Christmas-time which is to make you forget all the ordinary troubles of life, creating in their stead a Utopia where ill-feeling is as little known as *ennui*, and family jars are as impossible as personal discomfort and dissent. Holding this picture in your hand, you decline to subscribe your name to the *lo paan* universally chanted in praise of Christmas, and wrap yourself up in sullen silence when your neighbour congratulates you on having all your family about you, and wishes you a merry Christmas as if he meant it.

If the domestic aspect is disagreeable, what is the social?—A round of dinners of which the *menu* is precisely the same from Alpha to Omega:—turbot and thick lobster-sauce; roast-beef and boiled turkey; indigestible plum-pudding and murderous mince-pies; with sour oranges and sweet sherry to keep the balance even, and by the creation of two acids perhaps neutralise each other and the third. This is the food set before unoffending citizens under the name and style of Christmas dinners for the month or six weeks during which the idiotic custom of Christmas dinners at all is supposed to last. You are expected to live in this monotony of dyspepsia and antipathetic diet till you loathe the very sight of the familiar food, and long for a change with a vehemence which makes you ashamed of yourself, and more than half afraid that you are developing into a gourmand of the worst kind.

As if your nights were not sufficiently broken by the horrible compounds which trouble your digestion and disturb your brain, torturers known as the 'waits' prowl through the streets from midnight to dawn, causing you agonies beyond those which even the hurdy-gurdy men inflict. You are just falling to sleep—painfully courted and hardly won—when a hideous discord worse than the wailings of cats startles you into a nervous wakefulness which banishes all hope for that night. What can you do? They are too far off for that jug of

water to take effect, and you must not fire; anathemas do not hurt them, and if said aloud only waken up your wife and make her cry if she does not preach. You have nothing for it then but to lie still and groan inwardly, devoting to the infernal gods all the idiotic circumstances by which your life is rendered wretched, and your health, already frail, set still further wrong. In the morning, when wearied and nervously feverish from want of sleep, you go into the garden for a little quiet and delectation, you find your greenhouses stripped of the flowers which you had been lovingly watching for weeks, and your evergreens as ridiculously cropped as a shaved poodle. This is the day for the decoration of the church, and you, having made an expensive hobby of your garden, have to contribute what has cost months and good money to rear, for the childish satisfaction of John and Joan, lasting just two hours and five minutes. Not only have you lost your flowers and your evergreens—that splendid holly, which yesterday glowed like a flame, to-day nothing but a bundle of chopped ends!—but you know that your favourite daughter is flirting with the curate, and that a great deal is going on under cover of wreaths and crosses, laurustinus and chrysanthemum, of which you strongly disapprove yet cannot check. It is Christmas-time; decorating the church has become in these later days a kind of religious duty; and as a conscript father of your village, you must not forbid your daughter this pious pleasure any more than you can refuse your costly contribution in kind.

Turn to the financial side of the time; and what have you?—bills coming in that you neither expected nor knew of, and every one looking for a Christmas-box, and insolent or irritated if they do not get it. The servants obsequious to the worth of half a sovereign—tradesmen and their lads punctual in anticipation of half-crowns—postmen levying blackmail, and watermen and dustmen demanding as their right that they should be fed for their persistent neglect of duty—every one making a dead set at your pocket and trying to get your money for themselves—the very children more caressing and affectionate because it is Christmas and papa always gives them something on Christmas-day.—You groan as you ask yourself where is disinterestedness on this earth?—and you groan still more as you draw your cheques and reduce your balance and wonder by what law of right it is that you should be the pipe by which other folks are to be supplied.

No; you see no good or pleasure in this boasted Christmas-time as we keep it up in our benighted country. Its mirth is a sham and its inflictions are only too real. A time of tumult and expense, of indigestion and discomfort, you wait, grimly or fretfully as your mood may be, till it has passed and the current of your life is allowed to flow evenly as before. When you hear people sing its praises you long to stop their mouths, as you longed to silence the waits who woke you up out of your first sleep and spoil your rest for the night. What manner of men are these, you think, who can find cause of congratulation in so much absurdity, if the fun is real to them—so much dreary make-believe, if it is unreal? You despise your genial, laughing, merry-hearted neighbour who goes into everything *con amore*, and accepts it all, from forfeits and snapdragon to plum-pudding

and Christmas-boxes, as if he really liked it. You think what a fool he must be to be pleased with a rattle, tickled with a straw like this. But for the most part you do not believe in his mirth; and then you despise him still more as a hypocrite as well. For a hypocrite shamming folly is an offender against reason as well as truth, whom you find it hard to forgive, let the motive of his mummery be what it may.

This is one side of the question; your neighbour takes the other.

Who on earth, he says with his hands in his pockets, his back to the fire and his kindly smiling face to the room, who on earth can grumble at the facts of Christmas-time? For his part he finds it the jolliest season of the year, and he finds each season as jolly as the other, and all perfect in their own appointed way. He is none of your crying philosophers who go through life bewailing its miseries and oppressed by its misfortunes. Not he! He thinks the earth beautiful, men and women pleasant, and God very good; and of all occasions wherein he can transact his cheerful philosophy, Christmas is the best. The boys are home for their holidays; and it is a pleasure to him to take them out hunting and shooting, and initiate them into the personal circumstances belonging to English country gentlemen. He looks forward to the time when they will take his place and carry on the traditions of the family, and he wishes them to be worthy of their name and an honour to their country. He is not one of those nervous self-centred men who live by rule and measure and cannot have a line of the day's ordering disturbed. He likes his own way certainly; and he has it; but he can press his elbows to his sides on occasions, and give room for others to expand. He does not find it such an unbearable infliction that his boys should come home and racket about the place, even though they are a little upsetting, and do not leave everything quite as smooth and straight as they found it. He remembers his own youth and how happy it made him to come home and racket; and he supposes that his lads are very much the same as he was at their age. He thinks too that they do the girls good—wake them up a little—and while not making them rough or rude—the mother takes care of that—yet that they prevent them from becoming prim and missy, as girls are apt to be who have no brothers and are left too much to themselves. Certainly he does not approve of the flood of slang which is let loose in the house during their stay; but school-boy slang at the worst is not permanent, and in a week's time will be forgotten.

As for the married daughter's children, they are the merriest little rogues in the world; and his wife looks ten years younger since they came. She was always fond of babies; and her grandchildren seem to renew her own past nursery with all the pleasure and none of the anxiety of the olden time. He rather wonders at his girl's taste in the matter of her husband—most fathers do—and cannot for the life of him see what there is to love in him. But if not an Alcibiades he is a good fellow in the main, and makes his young wife happy; which is the principal thing. And if his daughter-in-law is a trifle stiff, and fond of giving herself fine-lady airs, he for his part never stands that kind of nonsense, and will laugh her out of it before she

has been twenty-four hours in the house. He finds good-humour and taking no offence the best weapons in the world against folly and ill-temper; and prefers them as curative agents to any other. The girl is a nice girl enough, but she has been badly brought up—had a lot of false ideas instilled into her by a foolish mother—but when she has been away from the old influences, and associated with themselves for a little while, she will open her eyes and see things in their right light. Who indeed could resist the sweet sensible influence of his wife, her mother-in-law?—and are not his girls the very perfection of honest wholesome English ladies? It will all come right in time; he has no doubt of that; and meanwhile they must be patient and forbearing for Dick's sake, and not make matters worse than they are by their own want of self-control.

Then as to the Christmas-boxes and the tips sacred to the season—well! well! after all they do not amount to much in the year, and see what pleasure they give! A nuan must be but a poor-spirited surly kind of hound who does not like to see his fellow-creatures happy; and a very little kindness goes a great way in that direction. He takes care to live within his income, and therefore he has always a margin to go on; and he does not object to use it. The servants have been very good on the whole, and do their duty fairly enough. And when they fail—as they do at times—why, to fail is human, and are they alone of all mankind to be blameless and never swerving in the right way? And are they alone of all mankind to be judged of by their worst and not by their best?—to be blamed for failure, but not praised for well-doing? He does not think so; and not thinking this, his half-sovereigns are given freely without the grudging which makes them an ungracious tax instead of a kindly voluntary gift. The tradespeople, too, do fairly well, and—they must have their profit like any one else! Those Christmas-boxes to their lads may be the nest-eggs for future savings; and even if they do go in a little finery or personal pleasure instead—young people will be young, and his own boys are fond of being smart and amused: so why not these others? You grumble at the waits? If you in your warm bed, well fed, well clothed, prosperous altogether, fret at the loss of an hour's sleep, what must these poor fellows feel, out in the cold frosty night, with the wind blowing and the sleet falling fast, and they not half fed nor a quarter clothed? For his own part he would like to give them a glass of hot grog all round; and as for grumbling at the few coppers which they brave all this physical discomfort to earn, he makes it shillings, and hopes it will do them good. We must live and let live, he says with his broad smile; and if we are sometimes a little inconvenienced by the efforts made by the poor to accomplish the art of living for their own parts—we must remember that our loss is their gain, and that they are men and women like ourselves—fathers of families who want to keep the pot boiling and the fire alight—mothers who love their children, and are anxious to do the best for them that nature and man will allow.

You complain of indigestion and grumble at the monotony of your Christmas fare?—That is strange! Who can grumble at good plain succulent meat?—and why do you eat the sweets if they

disagree with you? Neither pudding nor mince-pie comes into the eternal necessities of things, and you would do very well if only you would refrain. He does not eat things that he cannot digest, and in consequence he sleeps well, and when he wakes has neither regret nor remorse. Surely that is not such a painful trial—to forbear eating what is hurtful to your health, and in touching your health corroding your happiness as well.

In a word, the whole difference of the spirit in which we meet the facts of Christmas depends on the good or ill humour with which we are naturally endowed, and which we have cultivated by common-sense on the one hand, or suffered to ride rough-shod over our reason on the other. If we are unselfish and sympathetic, Christmas-time is as pleasant to us as popular tradition would make it; if we are egotistical and peevish, it is a wearisome infliction and a sham which no honest man can pretend to believe in, nor any sensible one to admire.

For our own part we believe in Christmas, because we believe in the kindness of man to man, in genial good-humour, in unselfishness, and the liking of wholesome natures to give happiness; and so far as we have gone yet we have seen no reason to change our views. A merry Christmas then to you all, friends, readers, and countrymen; and a happy New Year to follow after; and may God bless the rich and care for the poor, and lead us all in the right way while the day lasts and before the night has come!

A CAST OF THE NET.

THE STORY OF A DETECTIVE OFFICER.

CHAPTER IV.

LONG after it had grown quite dark, all remained quiet, and at last I resolved upon making a move. I had determined upon fetching Peter Tilley. I had plenty of assistance, but I thought I should like to have Peter with me. So I went down to the ferry; a gas-light which burned at the corner shewed me before I left my post that the bony ferryman was not there; and choosing a pretty good boat, with a strong young fellow to pull, I got in. It was a most unpleasant night; as dark as pitch, which was bad enough, but every now and then it lightened, which was worse, as it dazzled my eyes, and made me think we were running smash on board some great vessel which I had not seen a moment before, and couldn't see a moment after. However, the boatman was used to all kinds of weather, I suppose, and knew the river thoroughly; so through the darkness and the rain, which never left off for a moment, we reached the other side.

I left the boat to wait for me, and ran up to the *Yarmouth Smack*. I looked in, and saw Peter leaning against the bar and smoking a short pipe, as a labourer ought to do; and he was talking in a friendly way to some rough-looking fellows. I slipped in, and using the name we had agreed upon, spoke to him. He knew my voice of course; but seeing me so changed, for my make-up was really splendid (it was, although I say so that shouldn't), it gave him such a shock that he was

obliged to put the pewter down he was going to drink from and look steadily at me before he answered. 'I'm acoming,' he said at last, and we got outside; when, as we walked down to the ferry, I gave him a sort of idea of what was going on, and how I expected to make a great catch that night. Peter of course was very glad to be in for such a big thing as this, for he had never been mixed up with anything so important.

Not to trust the boatman too much, I kept Peter back a few yards from the water while I finished my story, standing a little on one side, so as to be out of the way of the people who came and went to and from the ferry. While I was talking to him, a wherry ran in; we heard her grate on the pebbles and the sculls rattle as the man laid 'em in; but that we had heard before. It's a part of my habit to notice little things however, and I looked to see who had come in by this boat. There was only one passenger, a woman, and she passed us walking quickly; but quick as she walked, I saw her, and she saw me. Blessed if it wasn't Miss Doyle! My being there was no odds to Miss Doyle, nor could it have signified to her if she had seen me fifty times; yet I felt I would rather not have met her just then; it looked unlucky, and she was such an uncommonly sharp one too. Sharp or not, I couldn't see what she could make out of my standing under a wall on a wet night talking to another labourer.

Having finished my explanation, we both got into the wherry, and I asked the man if he would like a good long job, which might perhaps last all night.

'The longer the better, governor,' he says, 'if the pay is accordin'.'

'The pay *will* be accordin', I answered; 'and so you are engaged.'

The first thing I made him do was to row round that oyster-smack, for the tide had risen enough to take us round her. I shewed no light, but we went inside her twice; and the fellow on the watch was very sharp, so he was leaning over the side when we came round the second time, and I could say quite quiet-like: 'I am in this boat now—watch the river.' That was quite enough; he knew he would not now have to look to the *Anchor* for signals.

After this began what I believe was the most disagreeable sort of patrol I ever had. There was a time when I used to envy the Thames police; but I can't say I ever did after that night. We were obliged to be in motion almost continually, because we did not know from which side of the river the paper might come, and we weren't quite sure that it would come at all, especially on that night; and I don't know, speaking from my own experience, that there is anything more trying to the spirits than the pulling backwards and forwards and loitering about on the river Thames in a raw October night with a small thick rain falling. Twice we landed, and went once to the *Smack* and once to the *Anchor*. I couldn't grudge the men a glass of hot grog; in fact I was obliged to have some myself, even if I missed my capture through it.

It grew later and later; the flashes of lightning still came at long intervals; but the lights on the shore went out, and excepting the gas-lamps which burnt at street-corners, ferries, and wharfs, all was dark. The traffic on the river had long

ceased, no shouts or rattle of wheels came from the shore; and the rain still falling, it was, I give you my word, most horribly miserable, dull and sloppy beyond description. Twelve o'clock had struck, and one, and perhaps half an hour beyond it. I had cautioned my companions to speak very low; so the boatman only whispered when he said: 'It's as quiet as it is likely to be, governor, if you've got anything to run. I have just seen the police galley creep along on the other side; I see her under that lamp. Now's your time.'

He thought we were smugglers! Perhaps he didn't care if we were thieves. I told him to be patient; when at that very instant, just as we were creeping along under the lee of a coal-barge, a wherry shot very silently by, right in front of us, going across stream, and not six feet from our bows. In her sat the sulky ferryman; I knew him at a glance, dark as it was. 'Pull after that wherry,' I said.

'Peter Tilley, my lad,' I continued, turning to Peter, 'the time's acoming, I think.'

'I'm precious glad of it,' says Peter; 'for I'm catching a cold in my head every minute I sit in this confounded boat; and it's all soaking wet where I'm sitting.'

Our man pulled on; he was a very strong fellow, as I have said, and we could have overtaken the other boat directly; but this of course I did not want. I knew where to look for the old scamp; and sure enough, after a few strokes across stream, he bent to the left and ran under the bows of the Dutch trader.

All was dark and silent as the grave aboard the ship; but that didn't deceive the old boatman, nor did it deceive me. I stopped our man in the shade of the next vessel, if you can call anywhere a shade, when it was all pitch dark. We had not been there a minute before I heard a slight noise—it was impossible to see any one unless he stood between you and the sky—and then I could tell by the sound that a man had dropped into the wherry. There was no need to tell me what man it was. With an almost noiseless dip, the ferryman dropped his sculls into the river again and rowed on, we still after him. I took it for granted he was going to the other side of the ferry; but he suddenly bore off to the right, and rowed on for some little time, then striking in between two vessels, he went straight for the land.

'Where is he going to?' I whispered.

'To the landing at Byrle's wharf,' says the boatman in the same tone.

So he was; and it appeared this landing-place was at the farther side of the wharf; that is, lower down the river.

It was so dark we could hardly see them—for we could just make out there were now two persons in the boat—but as they reached the shore, a lamp that was burning on the wharf helped us a little. We could not clearly see what they were doing; but they certainly got out of the boat, and as certainly there were then more than two figures moving about, and seemingly engaged in placing parcels in the wherry. But it was very gloomy there; they were in the shade of the wharf, and the lamp glimmered weak and faint through the thick rain. It was the more difficult to see what was being done, because there were several boats tied up to the landing-place, making some confusion in the darkness. At last, however, we could see that

they were pushing off from the shore ; so it was time for us to move. We pulled back for a while (there was no doubt as to which way the others would come), and then sheering off, lay between two colliers until we saw the wherry we had watched go by, and then we once more pulled after them.

'I'm blest if I don't think there's another boat following us,' says Peter Tilley, staring as hard as he could behind us. I looked, but couldn't see anything ; and Peter owned he might have been mistaken.

We could not make out how many there were in the foremost boat. There was only one man rowing, that was plain ; and he pulled short round at the proper place, as I knew he would, and rowed towards the Dutch trader. As he did so, we lost him for a second, a big steamer lying between us ; but the hull of this vessel did not obstruct the view up the river. I seized the moment, and waved my lantern twice. It was all right. As quick as thought the light on board the oyster-smack was moved twice also, and then we too were pulling across the stream. I wanted to capture my men on board the trader, as otherwise the paper might be got rid of, because I couldn't be positively certain that it was not already on board. In fact, Mr Edmund Byrle was my chief aim, not the skipper.

The wherry pulled under the bows of the vessel ; we followed just in time to see, by a very convenient flash of lightning, two packages handed up ; then a figure, which we had recognised by the same flash as the bony ferryman, got into the ship. As he disappeared, our wherry touched the vessel ; and at the same instant, to my great relief, a long black Thames police galley came alongside us, and its crew, five constables, with Barney Wilkins, who was there as guide, clambered up like cats. I and Peter imitated them, but not quite so quickly ; and when I looked over the bulwark, I saw by the light of a couple of lanterns, screened from the outside, four or five men, the boatman and the skipper being two, lifting up a great lid which fitted in the deck—the hatches I heard it called—while by their side lay the packages of paper. I could not see Mr Byrle ; but there was no time to consider ; we all jumped in at once, the men looking round in amazement at the noise. I fancied that just then I heard a shout from the boat.

'What do you all want here ?' said the skipper angrily.

'We hold a warrant'—I began.

'Oh, it is you, is it ?' he screeched, like a hyena, or something of that sort. 'I owe you a little for a past score, and you shall have it.' As quick as lightning he pulled a long straight knife from the side of his trousers, where it must have been in some sort of sheath, and jumped at me with such suddenness that he would have stabbed me, only Barney Wilkins snatched a handspike from the deck, and dashing between us, hit him down with such a blow, that the skipper fell with a crash like a bullock when it is killed, the blood pouring from his head instantly.

It was all as quick as thought. The other men were all seized in a breath. So quick was it all done, that I had no idea Barney was hurt, until he reeled, made a wild clutch as if he caught at something for support, and then pitched forward on his hands and knees.

'Hollo, Barney !' I said, stooping down to him. 'What's the matter, old fellow ?'

'It's all up, Mr Nickham,' he gasped ; 'he's done me. I only hope I've killed him. Where's the other ?'

'Oh, never mind the other, Barney,' I says. 'Where are you hurt ?'

But as I spoke, one of the men came with a lantern, and Barney had no occasion to answer me, for I could see a straight stream of blood running from his chest on to the deck ; and his hands giving way from weakness, he fell over on his side.

'Pull in for the shore, you, sir !' said the sergeant of the Thames police to my waterman. 'You know Marigold Street ? Knock up Mr Gartley, and tell him what has happened. Say we are afraid to move the man to his house, so he had better come aboard.'

'Send one of your own men, will you ?' answers the boatman. 'I've got something to tell the governor' (that was me), 'as I think he ought to know.'

'Cut away then, Bill,' says the sergeant to a constable ; 'these fellows are ironed, and we can manage all that are aboard this craft.'

So the man went off in my wherry ; and the Thames men tried to make poor Barney a little more comfortable, while I undid his waistcoat, hoping to stop the bleeding.

'It ain't no use,' he said ; but in that short time his voice was almost gone, and we could tell that he was dying. 'I'm done for, Mr Nickham. If there's a reward, you'll act fair and square, I know ; you always was a gentleman—let my sister have'— And with that he gave a gasp, and was dead.

I rose up, dreadfully vexed for the poor chap. The sergeant and one of his men were looking after the skipper, when I felt myself touched on the arm.

'I say, sir,' said the boatman, 'when I'm in for a thing, I go through with it honourable. Did you know as you was followed ?'

'Followed ? no !' I said.

'I thought we was !' said Peter Tilley.

'We was followed, sir, by a light wherry with two people in it,' continues the boatman ; 'and when they see our boats, they held hard ; and as you all boarded the ship and the noise began, they rowed away as hard as they could go.'

'Which way did they go ?' I said.

'Down river,' says the man. 'But it's of no use thinking of looking after them now. They are ashore long afore this.'

This was likely enough ; and it was quite certain that Mr Edmund Byrle was one of the two in the boat, and I had lost him for the present. Well, it couldn't be helped ; so we set to work to question the men and search the ship, till the doctor came. The men knew nothing more about the business than that they were going to have two passengers, a lady and a gentleman, this voyage. One of the Thames men understood Dutch, or we should not have heard even this scrap of information. The sulky boatman never uttered a word, except that once he said as I passed him, and he said it with a bitter curse : 'I always had my doubts of you.'

The doctor came off ; but poor Barney was stone-dead, while the skipper's skull was badly fractured. However, the paper was all there ; so I supposed,

and so it proved; and I shouldn't have cared if the skipper's head had been broken fifty times over.

We got our prisoners to the shore, leaving the craft in charge of a Thames police galley that came in answer to our signals; and late as it was, I drove with Peter Tilley in a cab to the City. Our people there were immensely glad, I can tell you; and when I went over to the Bank (for there was no need for secrecy or dodging now), I thought the gentlemen never would have left off paying me compliments. Poor Barney Wilkins that was dead deserved most credit; but it could not do him any good to say so now, so I let them go on. The paper was examined, and found to be exactly the quantity required; enough, I believe, to have made about twenty thousand bank-notes. Ah! if they had got into circulation!

I hope you will understand, however, that I did act fair and square; and when the reward was paid (and the Bank people did come down most liberal; I bought my house at Pentonville with my share), I told the gentlemen about poor Barney and his wishes; and I'm proud to say they found his sister out and took her away; and after a time she went abroad with kind people who looked after her, and took care of her money till she got married, and did well. Why, she sent me a snuff-box made out of pure Australian gold, with a letter signed by herself and her husband, who was a butcher in a great way of business out there; and they sent it as an acknowledgment of my having acted all fair and square. I promised so to do, and I did.

Edmund Byrle was never caught, and so far as we were concerned, was never heard of; and if it hadn't been for his father, I should never have understood a lot of things that puzzled me. I had given a pretty good guess as to how Miss Doyle came in the first place to inquire about Mr Byrle and the detective; a very clever idea in itself, but like many other clever things, it lost her the game. Mr Byrle had talked with his friends about employing detectives; and Miss Doyle knowing about the Bank paper, and being always on the watch, had got hold of just enough to mislead her. She went out with Edmund Byrle to Turkey, I think, and was married to him; and old Mr Byrle sent out a friend to see them; and it was in this way I got the particulars. It appears she knew me again—only as the limping labourer, of course—when she saw me talking at the ferry to Tilley. But she knew him as the detective at the *Yarmouth Smack*, and she thought that although it might be all right, yet a detective was a dangerous customer, and his acquaintances might be dangerous also. Consequently she tried to persuade Edmund to put off his journey; but he wanted the money for the paper, and wouldn't listen to her. But he agreed at last to go aboard in another boat, which satisfied her, as she felt so certain the skipper's boat would be attacked. As I have explained, her precaution saved him from fifteen years' 'penal,' which is the least he would have had. The skipper was sent for life, having killed a man in his arrest; but he didn't live six months in prison; he never got over the tremendous blow he received from Barney. All the reports spoke of his being a receiver of 'stolen goods.' The Bank paper was never mentioned, for the authorities did not want to unsettle the public again, or let them see what a narrow escape they had had.

And now comes about the queerest part of my story. Call me names if I didn't stop the thieving at Byrle's factory as well as recover the Bank paper, killing two birds with one stone.

It was all through my catching the bony ferryman. Finding that things was going hard with him, and hoping to make them easier, and being disappointed that those who were concerned with him did not come forward with money to provide for his defence, he 'rounded' on them; he split on them all, and owned how he was the means of taking the metal over to a fence on his side of the water, the things being stolen by a mechanic and a watchman who were in league. (I see I have used the word 'fence'; this means a receiver of stolen goods; but though I have been warned by the editor of this magazine, we can't do without some slang words.)

Peter Tilley got a tidy present, and was noted for promotion through this business. I was glad of it, for Peter was a capital chap—never wanted to play first-fiddle; and I admire people of that disposition. I tell you what I did: I got the newest five-pound note of all what the Bank gave me, and they were all very clean and crisp, and I wrapped old Bob the gatekeeper's own sixpence in it; and I went to the factory and I stood a pint of ale, and says: 'Bob, here's your sixpence!' He hadn't known exactly who I was till then, for I had made excuses as usual; and then I'm blessed if he didn't quite cry over his luck. Mr Byrle too thought a lot of Bob's kindness, for I told the old gent about it; and I heard that on that very account he put six shillings a week on Bob's wages, and I was glad to hear it.

They couldn't keep me off the detective staff after this; and although I am free to confess—now I am on my pension and nothing matters to me—that I only stumbled upon these discoveries by accident, I was praised to the skies by those for whom I worked. However, it all died away, as such things do; but I had managed to get my house at Pentonville, as I have hinted; and a pleasanter neighbourhood I don't know, or one more convenient for getting about. I have had some rather odd adventures since I have lived in my street; you can't help seeing strange things, if you keep your eyes open in London. But I didn't begin to tell about them. I have finished my account of the robberies at Byrle & Co.'s and my story finishes in consequence.

FEATS OF ENDURANCE.

LONDON, which has witnessed many strange doings in its day, was lately the scene of the most wonderful feats of pedestrianism ever accomplished within a given period.

Every hour, day and night, for six weary weeks a man plodded on his way round a measured track, until the grand total of fifteen hundred miles in one thousand hours had been made up, finishing his self-imposed task with his physical and mental faculties apparently unimpaired.

The task of walking fifteen hundred miles in a thousand hours had never before been attempted, and henceforth the new achievement will throw into the cold shade of obscurity even the marvellous act of walking a thousand miles in as many

hours, which was once accomplished in 1809 by Captain Robert Barclay of Ury, a Scotchman, who proposed to perform the then incredible task of walking a thousand miles in a thousand consecutive hours. The proposition was received with every sign of incredulity, though, when the affair was finally arranged to take place, many thousands of pounds were staked on the event. Newmarket Heath was selected as the scene of the exploit, and the famous walk began on the 1st of June 1809, at midnight. It is unnecessary to repeat the details of this feat; it will suffice to mention that the enterprising captain completed his task on the 12th July, at four o'clock in the afternoon.

Since then, an attempt has, we believe, been made to walk the same distance *backwards*; and within the past twelve months, Weston, the American pedestrian, has performed some remarkable exploits of the kind; being however at last beaten by an Irishman named Kelly.

The hero of the lately completed task (fifteen hundred miles in a thousand hours) is a little Welshman of not more than five feet three and a half inches in height, and about forty-two years of age; while in personal appearance and general *physique* he presents anything but what is usually supposed to be the characteristic of a good pedestrian. His name is William Gale, and he is a bookbinder by trade, living at Clerkenwell.

At the commencement of his task on Sunday the 26th of August, he weighed no more than eight stone four pounds (8 st. 4 lbs.); and from that day until Saturday the 6th October, during a portion of every hour day and night, he pursued his monotonous way around the inclosure at Lillie Bridge grounds, Brompton. When the attempt was first announced, even those most acquainted with pedestrian feats where great endurance was required, expressed themselves dubious as to the result; and in order to have a reliable record of his proceedings, Gale requested the different sporting papers to appoint competent men as judges—a request which was at once generously complied with.

Thus we have an official report of his great exploit, and the public are enabled to judge for themselves on the nature of the feat performed. Gale's average pace appears to have been about four miles an hour; but when he had reached his thousandth mile he assumed a brave spurt, and footed it in ten minutes, or at the rate of six miles an hour. During the last few days of his walking he started rather stiffly at first, owing to the pain caused by the swelling of some varicose veins in his left leg; but undaunted by so great and manifest a disadvantage, and other disadvantages which we shall presently refer to, the gallant little Welshman 'plodded his weary way' with a determined pluck that won the admiration and applause of every one present.

On Friday the 5th October, the day before the finish of the tramp, Dr Gant of the 'Royal Free

Hospital was called in to see this extraordinary walker, and after examining his legs, he pronounced Gale to be in excellent condition so far as his physical powers were concerned; there being no fever, the pulse only seventy, no murmur at the heart; and the varicose veins which had been the cause of so much pain to him, were rather better than worse, having considerably decreased in size. Perhaps the most remarkable part of the performance is, that it has been accomplished on a system of training which entirely sets at variance all athletic rules, for Gale partook of no fixed refreshment, neither did he have his meals at stated hours. His chief food was plain mutton-chops; and as an instance of how he varied his dishes, his afternoon meal on Friday the 5th October, which might have been either breakfast, dinner, or supper (so irregular had he been in this respect), consisted of a lobster and bread and butter, followed by a fried sole, and one or two cups of ordinarily strong tea. During the walk he also drank a good deal of beer—not strong beer, but the ale which is usually sold at fourpence per quart, which he seemed to prefer to any other kind, probably on account of its freedom from that tendency to increase rather than assuage thirst, so remarkably apparent in the stronger beers.

Many strange incidents occurred in the course of the six weeks, which were calculated to while away the time, and occasionally to bring a smile to the pedestrian's lips. For instance, a certain illustrated sheet, notorious for its very sensational cartoons, published a picture of Gale on the track followed by Old Time with the conventional scythe on his shoulder; and many people it would seem actually paid their money with the idea that they were going to see the two figures as thus represented. One man, who had evidently gone to the grounds for this purpose, had watched Gale go round the track several times, when he could no longer control his disappointment. He shouted aloud, angrily demanding his money back, because, as he said with the greatest *naïveté* possible, 'the beggar with the scythe hadn't turned up!'

As the last week of the great walking match wore on, signs of weariness in the indomitable pedestrian became painfully apparent, and many persons began to fear that the task he had set himself would after all remain unaccomplished. On several of the rounds he fell asleep whilst walking, and dropped to the ground; but this contact with mother earth seemed to revive him instantly, and he plodded on as pluckily as before.

At length success crowned his efforts; and at seventeen minutes past five o'clock (less a second) on Saturday afternoon the 6th October 1877, Gale terminated his long and dreary walk in the presence of a large, fashionable, and enthusiastic assemblage, who rewarded his efforts with several rounds of hearty applause.

From the commencement of his task to the finish Gale bore up against all obstacles with extraordinary pluck and determination, his last mile being performed in *ten minutes and eight seconds*. He was at once removed to the tent or pavilion under which he had snatched so many brief half-hours' rest, and was examined by three medical men, who found that his heart was quite natural in its movements, and that the temperature of his body did not exceed one hundred and six degrees.

The great feat which has thus been accomplished without the aid of artificial training, is a marvellous instance of what human endurance, allied with courage and determination, can effect; though of what particular benefit it may be to the world at large it is utterly impossible to imagine.

Since the preceding account was written, Gale has accomplished a still more extraordinary feat, and one which for strength of will and physical endurance far surpasses his previous efforts. We still fail, however, to see the benefit which can accrue from exhibitions of this kind, and well might he have been contented with the laurels he had already won. He had scarcely allowed himself time to recover from his former task, when he once more appeared at a public place of entertainment, namely the Agricultural Hall at Islington, to walk four thousand quarter-miles under the astounding condition, that it was to be done in four thousand consecutive periods of ten minutes.

This of course deprived him of the half-hour's rest which he could obtain at one time in the former race, and only allowed him a few minutes between each round to get a little sleep. Despite these drawbacks, however, Gale finished his task at eleven o'clock P.M. on the 17th November, after a dreary walk of nearly four weeks. By accomplishing his task, he has placed himself at the head of all the famous pedestrians the world has known; and we trust that this fact will be sufficient to satisfy his craving after what is at best but ephemeral fame.

Men have on many occasions attempted walking feats which required a vast amount of physical endurance, and have failed from their utter inability to go without the natural quantum of sleep; but Gale has not only shewn himself to be possessed of the former, but to be altogether independent of the latter. This, however, instead of indicating 'pluck' merely, would rather seem to point to a peculiarity in the man's constitution; as there are doubtless many persons whose courage would enable them to perform the same or even a greater task if, like Gale, they could walk about in a state of somnolency or semi-sleep—a state in which, to use his own words, he was as one in a dream, unconscious of all that was going on around him, and believing himself to be walking in forests and other places of silvan beauty; and the truth of this was made evident by the fact that he would have often exceeded the limit of his walk had not the voice of his attendant aroused him from his stupor.

The average time occupied by this extraordinary walker was by day about three minutes for each quarter of a mile, and by night about five minutes; and the fastest round recorded was done in two minutes and forty-two seconds. His pulse was always found to indicate a perfect state of health, and was as regular when he left off as when he commenced his task. His food consisted principally of fish, fowl, chops, eggs, and light puddings; and his drink was, with only one exception during the whole time, tea.

Perhaps the most remarkable thing about the whole affair was the fact that, although he sank into a deep sleep directly he reached his chair behind the curtain, which hid him from view between his walks, the moment the bell rang

the second time, he would appear as fresh as ever and begin trudging away again.

When the feat was accomplished, Sir John Astley stepped forward, and amid a scene of great enthusiasm, presented the undaunted Welshman with a silver belt of the value of a hundred guineas, bearing the following inscription: 'This belt was presented to WILLIAM GALE of Cardiff, on the 17th November 1877, by some of the nobility and gentry of Great Britain, in commemoration of his hitherto unprecedented feat, namely walking one thousand five hundred miles in one thousand hours at Lillie Bridge Grounds, August 26th to October 6th, 1877; and four thousand quarter-miles in four thousand consecutive periods of ten minutes, at the Agricultural Hall, London, October 21st to November 17th, 1877.' The belt is of lion's skin, mounted on velvet, the metal portion of it weighing one hundred ounces of sterling silver.

None will begrudge Gale his well-earned reward; but it is to be hoped that such exhibitions will in future be discountenanced by the general public, as they not only detract from the dignity of man, but are needless and unwarrantable in a country which, we trust, will ever pride itself on a nobler civilisation than that which is founded upon mere physical endurance.

A DIFFICULT QUESTION.

THE STORY OF TWO CHRISTMAS EVES.

IN TWO CHAPTERS.—PROLOGUE.

IN the gray light of an Indian dawn, with the cool breeze blowing through the curtains of the tent, and his friend's sorrowful eyes looking down on him, a soldier lay on his rough couch—waiting for death. They were soon to be parted those two, who had lived and fought together; but the face of the one who was starting on that journey of which none has measured the distance, was smilingly calm, while the eyes of the other glistened with regretful tears as he spoke low, faltering, remorseful words.

'Hush, Ralph, hush!' the other said at last. 'Don't you think, dear old fellow, I would sooner lose my life in having saved yours, than in any other way? After all, a few days or years sooner or later, what does it signify? My fate is perhaps the happiest, though I hope it is not. I don't think life is so very desirable,' he continued; 'I am only twenty-six; but mine has not been a happy one. It was my own fault, though. Take my advice, Ralph; don't marry young. There is only one thing that troubles me'—

'Your little girl,' Ralph interrupted. 'Wrayworth, let me take care of her; if I can make her happy, it will be some slight atonement, some'—

'You would take care of her, Ralph? would you?' The dying man's eyes shone gratefully as he looked up in his friend's face. 'She has nothing, poor little thing,' he went on sadly—'motherless, fatherless, scarcely more than a baby either. It would be a heavy charge to leave you, Ralph.'

'Wrayworth! how can you speak so; you will drive me mad! You—you'— He broke down

utterly; it was something so terrible to see this friend dying there—for him. 'Anything on earth that I can do'—he murmured.

'You will do for her,' said Wrayworth. 'Thank you. I have no friends to send her to. I meant to have made her very happy.'

'She shall be; I swear it!' Ralph answered fervently, thankful for this charge, which might in some degree help him to pay that debt of gratitude, and forgetful that he had no control of fate, that the promise he gave of happiness was a fearfully presumptuous one. But he made it willingly, gladly, solemnly, before God; and as far as lay in his power it should sacredly be kept; any sacrifice he would make for this child.

His friend's eyes rested on him searchingly for a moment. 'I trust you,' he said—'I trust you.'

The hours passed on, the blazing sun arose, and Ralph went out into the burning glare with bent head and staggering footsteps, while words he had heard long since seemed floating round him in letters of fire: 'Greater love hath no man than this, that a man lay down his life for his friend.'—'Is there none greater!' he thought. 'Is there nothing I can do to repay—nothing?'

CHAPTER I.—ASKED.

The years were well on in their teens since that melancholy scene was enacted in the Indian tent—since Wrayworth consigned his only child to the guardianship of the friend whose life, at the expense of his own, he had saved on the battle-field. A carriage rolled along the snowy high-road through the cold clear air; the short winter's day was drawing to its close, and up in the darkening sky the stars were beginning to shine upon the world's most joyful season, upon Christmas eve. The world's most joyful season? We call it so, this festival, more than eighteen hundred years old; but does the world think it so?—the world, with its thousand cares and crosses, its deep and hidden sorrows, its partings and its tears? Of those amongst the myriads who keep the Yule-tide feast, how many hold it with a chastened joy! For on that day most of all our thoughts go back to other years, to other faces, to other lips that have wished us 'a merry Christmas;' to other hands, which have clasped ours so loyally, to those who have loved us so long ago!

But Major Loraine had no sad memories connected with the season as he drove up to the old house, from which duty had so frequently called him, and which he had not seen for five years. In the wide, dark, panelled hall his step-mother stood waiting to welcome him, as gladly as though he had been her own son. He was only a boy when she first came there, when the pink was fresh on her cheek and the gold bright in her hair; they had been drawn to each other then; and through the long years of her widowhood his loving care had helped to lighten her load of sorrow; so it was not wonderful that for months past she had been eagerly looking forward to his return.

The greetings over, they sat down side by side, talking, as those talk after long separation, of past, present, and future; of their acquaintances married, dead, or far away; of things on the estate, prosperous or failures; of the ball to be given next month, of the one they were going to, to-night; of how

much Emma was improved since she came out, how Katharine was considered one of the loveliest girls in the place, and how she might marry Sir Michael Leyland with thirty thousand a year if she liked.

'But why ever doesn't she like?' asked the Major, astonished at this new phase in the character of his worldly-minded sister.

'That is just what troubles me,' answered Mrs Loraine. 'They are all at the church now, helping to decorate. Louise wanted to stay at home to welcome you, but I sent them all off, so as to have you to myself for an hour. You will see a great alteration in Louise, Ralph.'

'Shall I, mother?' he said smiling. 'I think not. Her letters are the same always; they have altered in style a little of course in the last year or two, but it is the same spirit—the same creature.'

'But not the same face, Ralph. Remember you have not seen her for five years, which have not altered you, but which have changed her from an unformed girl of fourteen to a lovely woman; with that bright changing beauty, which has more charm for a man than regularity of feature. It is a very difficult question.'

'What is a difficult question?' asked Ralph, as his mother paused.

'What to do with Louise.'

'You hinted something of the kind in your last letter, mother,' he said gravely. 'I am sorry, but I must confess this house seems large enough for four women. You know how I am situated; you know the promise which binds me. But tell me,' he added smiling, 'what has Louise done? She seemed to me gentle and tractable enough when I was last at home.'

'I have not the slightest fault to find,' Mrs Loraine replied; 'you know I am very fond of her. You will think my difficulty very womanish; simply, Louise is too pretty.'

'And some one has told her so,' said Ralph, laughing. 'Go on.'

'It is not that; but I cannot bear to see my own child's happiness destroyed by another, who, if not a stranger, has at least no claim upon her.'

Ralph frowned slightly. 'Perhaps not,' he answered; 'the claim is upon me, and it is a sacred one. So,' he continued, 'it is a case of rivals, I see.'

'Simply this, Ralph. You remember the Levesons, of Leigh Court, where we are going to-night? Their eldest son is in the —th Dragoons, and has been home on leave. Louise was away when he first came here, and he appeared very much struck with Katharine; and no wonder; she is very handsome. Well—don't laugh at me; I don't like match-making as a rule; but I thought as she seemed interested in him, there was no harm in inviting him sometimes. But as soon as Louise came home, he transferred his attentions to her. Katharine says nothing; but it makes a kind of awkwardness between them. I know she feels it, poor child; though indeed I believe Vere Leveson is simply flirting with Louise.'

Major Loraine laughed. 'Poor mother!' he said, 'you will have enough to do if you take all your children's love affairs to heart so seriously. These things always right themselves, you know. But I confess I am surprised to hear of Katharine going in for sentiment; I should have thought Sir Michael more in her line. Is that all, mother?'

'No; only the first of my difficulties,' she answered half sadly. 'You know what my health has been for the last few years; you know— Well, you do not wish me to speak of that; but it is better to look in the face of possibility. Suppose anything happened to me, Ralph, what would become of Louise?'

'You speak of what I hope may be far distant, mother,' he answered tenderly. 'But why should you be uneasy about her? In the event of her not marrying, she would always have a home here with me.'

Mrs Loraine shook her head. 'Turn round and look in the glass,' she said; 'thirty-nine is not such a very formidable age.'

He turned, and contemplated his bronzed face in the glass; such a handsome, noble face, telling of a nature that could not act falsely or meanly. The broad square forehead, marred by a sabre-cut, and the dark hair flecked here and there, by the Indian sun, with gray; nothing else to find fault with in the frank kind smile, the fine regular features, the dark true eyes.

'I think there is no fear of my being taken for younger than I am, mother,' he said, smiling.

'It is an awkward position for you, though,' she answered; 'and as I said, a difficult question what to do. We must hope for the best, Ralph. You are going to join the others now, I suppose?'

'Yes; I think I can find my way.'

He went out into the keen frosty air, walking slowly, though it was unpleasantly cold to one accustomed to tropical climates. He was thinking over his mother's words, and knew she was right as to the awkwardness of the position. He saw the peace of the household was troubled, without knowing how to set matters right, and he thought of the old friend who had trusted his child to him. He had vowed she should be happy, and now it seemed a difficult vow to keep; but for the sake of the man who had died for him sixteen long years ago, the pledge then given must be redeemed.

Louise Wrayworth's life had been a bright one hitherto; her guardian's home was the only one she could remember, and he had striven to fill in some degree her father's place. To him, from infancy to womanhood, she had looked up with loving grateful reverence, regarding him, present or absent, as the noblest of created beings.

He reached the old church, and made his way round to the open vestry door. The steps were encumbered with bundles of evergreens; the voices of the workers, who had finished their task, were audible. He pushed the door further open, and went in. The floor was covered with boughs, and around the pillars were wreathed holly and other evergreens in honour of the joyous season. Some of the choristers stood waiting for the choir-practice, and the organist was softly playing *Adeste Fideles*.

'Ralph!' cried a young fresh voice; and a slight fair girl with a merry face sprang up from the floor, with her hands full of the scarlet berries, which fell hither and thither in bright-hued rain, as with complete indifference to the by-standers, she gave the returned soldier a sisterly embrace. 'You dear old thing to come for us!' she exclaimed.

'Emma, Emma!' exclaimed Ralph, laughing and disengaging himself; 'you have not learned to behave any better in five years.'

But his young sister had vanished, and he turned to greet the vicar; and one or two of the ladies he recognised. In a few minutes Emma reappeared; and behind her came a tall fair girl with masses of golden hair, and great beautiful cold blue eyes. She greeted Major Loraine affectionately, but with the quiet stately grace habitual to her. Five years had not changed Katharine Loraine; at twenty-four she was still the same majestic Queen Katharine as at nineteen, with whom he had always had so little sympathy, whose nature he had found so difficult to understand.

'Where is Louise?' he asked presently. 'Is she not here?'

'She went into the churchyard just now,' answered Emma, 'to put a wreath on Nellie Bryant's grave. You remember her, Ralph?'

'Louise's friend? Yes.'

'A *triste* employment for Christmas eve,' observed one of the gentlemen decorators to Katharine, as he stooped to disentangle her dress from a long sprig of ivy.

'Oh, Mr Leveson went to hold a lantern for her,' Katharine answered, with the slightest possible shade of contempt in the silvery tones of her voice; 'and Louise is never *triste*, unless she is by herself.'

The choir was now fully assembled; the organist struck up the anthem, the rest were silent to listen, and Ralph Loraine went out to look for his ward. He came round the east end of the old church, and stood still for a moment in the shadow. There were two people standing at the edge of the path, looking down on the grave at their feet, where the lantern's light shewed the shining holly upon the upright marble cross. It shewed too the face of his friend's child; a beautiful face, as his step-mother had said, with large dark eyes and wavy dusky hair, a clear delicate complexion with a little rose-flush on the cheeks, and full red lips half-parted by the sweetest smile he had ever seen; with the same erect carriage of the head, the same fearless straight regard which had characterised her father.

It was so strange to see her there a woman, whom he had left a mere girl; and as he looked on the fair face, something seemed to whisper that the ideal beauty he had so often dreamed of was before him at last. They moved away, and came slowly nearer, and paused again where he could see her companion; and for a moment he almost hated the man for his youth, and his handsome face, and the deep-blue eyes aflame with passion-fire as they rested on the child of his dead friend; and another whisper which silenced the first, told him how fitted was each for the other.

'If I were lying there,' said Vere Leveson, and Ralph could hear every one of the foolish, softly spoken words, 'would you ever make wreaths for me, I wonder?'

'I don't know.'

'Don't you? I wish you did; for I thought just now I should be glad to be lying there, if you would remember me.'

Ralph had heard enough, and tried to slip away unseen; but the gravel crunched under his feet and betrayed him.

Louise started, and a bright vivid blush covered her face as she sprang forward. 'Lorrie! Oh, how glad I am to see you again!' she cried, as she

took both his hands in hers and lifted her cheek for his kiss.

He felt half sorry she had done so; that and the old childish name put him immediately in his place as guardian, and made him ashamed of his thoughts. 'How you are altered, Louise!' he said, looking down at her admiringly. 'I think I should hardly have known you!'

'I should have known you, Lorrie, anywhere,' she said reproachfully.

'That is rather different,' he said; 'when we once get old, we don't change so quickly.'

'You would not like it if I said you were old, Lorrie. But tell me, am I altered for the worse?' or—

'You have no need to come to me for compliments, surely,' he said smiling.

'I should think more of yours than of any one's,' she whispered, with that sweet dangerous smile; a smile which a man like Ralph Lorraine should have taken as a warning not to feel its influence too often.

'How rude I am!' she said at last. 'Mr Leveson, do you know my guardian?' She turned to her companion, who stood holding the lantern a few yards from them.

'I had the honour of dining in your company once, Major Lorraine,' he answered, stepping forward. 'It is some time ago, when I first joined at Madras; but I well remember my anxiety to see such a distinguished soldier as yourself.'

There was a ring of truth and honest admiration in the words, which raised them above an ordinary compliment, and which made Ralph hold out his hand and answer cordially: 'I have a bad memory for faces, or I think I should have remembered yours.'

'Thanks,' said Vere, laughing. 'We shall have the pleasure of seeing you to-night, I hope?'

'Yes; my mother told me of the invitation.'

'Of course he is coming,' said Louise. 'And you will dance with me all the evening, Lorrie; won't you?'

'Not quite all, Miss Wrayworth; please, don't forget my waltzes,' said Vere, holding out his hand. 'I must be off now; so good-bye for the present. You won't forget?'

She looked up quickly. 'Perhaps,' the lips said laughingly; but the dark eyes gave a sweet silent answer Ralph did not see, though he was watching them. But after Vere Leveson had gone, he walked home beneath the Christmas stars, with Louise's hand resting on his arm, dreaming as he went, a fair, fond, foolish dream.

The Christmas-eve ball at Leigh Park was a regular institution, one which Sir Harry Leveson had kept up for years. It was a pretty sight, Ralph thought, as he stood leaning against a window, and looking round to select a partner. And amongst all the fair women, the one he thought the fairest was his young ward Louise Wrayworth, in her white floating dress, with its wreaths of holly, and the red clustering berries in her dark hair.

Ralph had been watching Vere Leveson, trying to decide in his own mind whether Mrs Lorraine's verdict of flirtation was a just one; and he judged that it was; for the attentions of the young officer were apparently equally divided between Louise and Katharine. Ralph did not happen to

be near when, later on, he led Louise to one of the cool empty rooms, where through the open window could be heard the merry Christmas bells. He did not see the hand-clasp or the light that flashed in the eyes of each. He did not hear the hurried whisper: 'Louise, you won't forget me, you will trust me till next Christmas-time?'

The ball was over, the rooms were dark and silent; the whole world waited for the sun to rise on Christmas-day.

IS THE TELEPHONE A PRACTICAL SUCCESS?

IN September last appeared in this *Journal* an article entitled 'Singing and Talking by Telegraph;' and in that paper we attempted to describe the mechanism of that wonderful little instrument the telephone. It is now our purpose to say something regarding the progress that has been made towards perfecting the invention; but in order to make the article as clear as possible, we venture once more upon a few words explanatory of the instrument.

The telephone as it is now made is an exceedingly simple-looking apparatus similar in appearance to a stethoscope; to the handle of a girl's skipping-rope; or better still, to a large-sized penny wooden trumpet. Inside this hollow cylinder, and within an inch or so of the wider end, is fixed a plate of iron as thin as a well-worn sixpence, and about the size of a half-crown piece. This is called the diaphragm. Behind the diaphragm, nearly touching it, and extending to the narrower end of the cylinder, is a piece of 'soft' iron enveloped in wire coils, with a permanent magnet beyond. Outside the narrower end of the cylinder, and communicating with the coils that surround the iron inside, are attached two screws or 'terminals,' which are 'joined up' to a main wire, communicating with the distant or receiving telephone wherever that may be, and which is precisely similar to the one we have described. When we apply our mouth to the bell-shaped end of the apparatus, and speak or shout or sing, we set the diaphragm vibrating as in a tuning-fork; the vibrations thus created are electrically communicated through the wire to a distant telephone, and are repeated on its diaphragm with more or less distinctness.

It is known that the motion of an iron plate contiguous to the poles of a magnet creates a disturbance of electricity in coils surrounding those poles; and the duration of this current will coincide with the vibratory motion of the plate or diaphragm. When, therefore, the human voice (or any other suitable sound) impinges through the tube against this diaphragm, the diaphragm begins to vibrate, and awakens, so to speak, electrical action in the coils of wire surrounding the poles of the magnet; not a current, but a series of undulations, something like those produced by the voice in the air around us. In short the telephone is an apparatus designed to transmit sound through a wire of indefinite length; the voice being, so to speak, 'converted

into electricity at one end, the electricity becoming voice at the other.'

With these few explanatory remarks, we now proceed to offer to our readers the following interesting experiments made by a gentleman well skilled in telegraphy.

'Journalists,' he says, 'with no special knowledge of the difficulties the invention has to encounter as a telegraph instrument, have expatiated in such enthusiastic terms upon the results said to have been achieved by the telephone, that a somewhat exaggerated notion of its powers and capabilities has been accepted by the general public. It appears, therefore, to the writer of those lines that a statement of the experiences of a person practically engaged in the work of telegraphy may assist in placing the phenomena of the telephone on a proper footing.

'Scientifically, the telephone is a great and undoubted success; and a person would be grievously in error if, because of some undoubted hindrances to its practical use, he pronounced it unworthy of further experiment. The emergence of telegraphy from the domain of experiment into that of daily practical use is a fact so undoubted, and one with which we are now so familiar, that it is impossible to say at what moment the telephone, at present a scientific toy, may become a daily necessity not only of telegraphic but of ordinary commercial work.

'Being engaged in daily contact with a large telegraphic centre, and in association with men who have the command of every means of testing the invention in a practical work-a-day manner, the writer was able to gauge pretty accurately the range within which the telephone can work. It must be understood, however, that in recording the effects observed by him and his associates, he has no desire to invalidate, or even to call in question the experiences of others who may have been able to arrive at better results. The telephone is in the hands of some of the first electricians and telegraphists of the day, and differences of conditions (not to speak of differences of capacity on the part of the operator) may give variety in the observations made. The very difficulties and drawbacks now to be recorded will no doubt some day suggest to a master-mind the method by which they may be overcome. But till that day arrives, the telephone must be content to remain where the writer leaves it, an undoubted success from a scientific point of view, but overwhelmed with obstacles to its practical use, in this country at least, in general telegraphy.

'When a telegraphist first gets into his hand this beautifully simple and electrically delicate instrument, his first inclination is to test its carrying-power. This is of course a closet experiment, not working with actual telegraph line, but with "resistance" equivalent to a telegraph line of stated length. An experiment of this nature gives better results than could be obtained by a veritable line, because the insulation is, so to speak, perfect. No leakage at 'undesigned points of contact, or disturbance from unfavourable atmospheric conditions, is felt, and the experiment is entirely under the observer's control. The apparatus used is designed to offer the same labour for the electric current to overcome, as would be offered by a stated length of outside telegraph line. This artificial resistance is nicely graduated, and as

the method of testing was suggested by Ohm, a German electrician, the unit of resistance is, as we once previously explained, termed an "ohm." Removing the telephone to such a distance that the two observers were "out of earshot," the test with resistance was tried, and with a resistance of one thousand ohms—roughly speaking, equal to seventy miles of a well-constructed line—the sound was perfect, although not very loud. Every articulation of the speaker at the other end could be distinguished so long as silence was maintained in the room, or so long as no heavy lorry rumbling over the stones outside sent in harsh noises which drowned the faint whisper of the instrument. The resistance was gradually raised to four thousand ohms—nearly three hundred miles—with like favourable results; and for some little distance beyond, articulation could still be made out. But by the time ten thousand ohms had been applied, putting the speaker at a distance of, say, seven hundred miles, sound ~~only~~, but not articulate sound, reached the ear. The tone was there, and every inflection of the voice could be followed; but articulation was absent, although the listener strove every nerve to catch the sound, which the speaker, as was afterwards ascertained, was shouting in a loud clear voice. The prolonged notes of an air sung could be heard with the resistance named, but again no words could be distinguished. The voice, whether in speaking or singing, has a weird curious sound in the telephone. It is in a measure ventriloquial in character; and with the telephone held an inch or two from the ear, it has the effect as if some one were singing far off in the building, or the sound were coming up from a vaulted cellar or through a massive stone wall.

'Proceeding to our next experiment, we joined up the telephones in one office to several wires in succession, putting ourselves in circuit with lines going to various distances and working with different instruments. When this was done, the real obstacle to telephonic progress at once asserted itself in the shape of "induction." The first wire experimented with was partly "overhouse" and partly underground, and the offices upon it were working Wheatstone A B C instruments. It is difficult to render clear to the person ignorant of telegraphic phenomena the idea expressed by the word *induction*. Briefly it may be put thus, that when a strong electric current is passing on a wire, it has the faculty of setting up a current of opposite character in any wire not then working, or working with a feebler current, that may be in its vicinity. The why or the wherefore cannot be explained, but there is the fact.

In various recent articles on the telephone, mention has been made of "contact" as the cause of disturbance. This word, however, although it has been used by telegraphists, is misleading, and can only be used as an endeavour to express popularly an electric fact. Actual contact of one wire with another would spoil the business altogether. A wire bearing an electric current seems to be for the time surrounded, to an undefined distance, by an electric atmosphere, and all wires coming within this atmosphere have a current in an opposite direction set up in them. This is as near an explanation of the phenomena of induction as the state of telegraph science at present affords. Now the telephone works with a very delicate magnetic

current, and is easily overpowered by the action of a stronger current in any wire near which the telephone wire may come. To work properly it "requires a silent line."

"In the place where the observations were made, there are a large number of wires, travelling under the floor, through the test-box, along passages to the battery-room and to a pole on the outside, whence they radiate, or out to a pipe underground, where many gutta-percha-covered wires lie side by side. On applying the ear to a telephone joined into a circuit working in such an office a curious sound is heard, comparable most nearly to the sound of a pot boiling. But the practised ear could soon separate the boiling into distinct sounds. There was one masterful Morse instrument—probably on the wire lying nearest the one on which we were joined up—whose peremptory "click, cli-i-ck, click," representing "dot, dash, dot" on the printed slip we read from, could be heard over all. Then there was the rapid whirr of a Wheatstone fast-speed transmitter, sending dots and dashes at express speed by mechanical means; the sharp well-pronounced rattle in sounds of equal length of a needle instrument; and most curious of all, the "rrrr-op, rr-op, rrrrrrrrrrr-op, rrrrr-op, rr-op" of the A B C, the deadliest foe to the telephone in its endeavours to gain admission into the family of telegraph instruments. There may be reason in this, for as the Wheatstone A B C is the instrument used for private telegraphy, or for the least important public offices, because it requires no "code" to be learned by the manipulator, so it would likely be the first to be displaced if an acoustic telegraph permanently took the field. So the sentient little A B C opens its mitrailleuse fire on the intruder, on whose delicate currents, in the words of an accomplished electrician, it plays "old harry." The peculiar character of the sounds we borrow on the telephone from this instrument arises from the fact that as the needle flies round the dial, a distinct current or pulsation passes for each letter, and the final "op" we have tried to represent shews the stoppage of the needle at the letters as words were spelled out.

"It must not be understood that the sounds of those various instruments are actually heard in the telephone. What happens is, that the currents stealing along the telephone wire by induction produce vibrations in the diaphragm of that instrument, the little metal membrane working on the magnet in ready response to every current set up in the latter. When it is remembered that the principle of the telephone is that the sound-caused vibrations in the filmy diaphragm at one end create similar but magnetically-caused vibrations in the diaphragm at the other end, and so reproduce the sound, it will be obvious why the rapid roll of the A B C currents, or the swift sending of the fast-speed transmitter, when brought by induction into the telephone wire, cause disturbances in the sound vibrations, and thereby cripple the instrument. One instrument of either kind named would have a certain effect, but one Morse or single needle would not have any greatly prejudicial effect. But a number of Morses or needles going together, such as were heard in our experiments, would combine to be nearly as bad as one A B C or fast-speed Morse. So delicate is the diaphragm to

sound (and necessarily so), that in all experiments with the telephone itself, such as those with "resistance," or those made at home to test the instrument apart from telegraphic considerations, every sound from without broke in, giving an effect like the well-known "murmur of the shell."

"Joining up our wire now to a more distant station at some miles along the railway, and having on its poles a number of what are known as "heavy" circuits, the pot-boiling sound assumed even more marked characteristics. The A B C no longer affected us; but a number of Morse instruments were in full gear, and the fast-speed transmitter was also at work. While we were listening, the circuit to which we were joined began to work, and the effect was literally electrical. Hitherto we had only borrowed currents—or, seeing they were so unwelcome, we might call them currents thrust upon us—and the sounds, though sharp and incessant, were gentle and rather low. But when the strong current was set up in the wire itself, the listener who held one of our telephones nearly jumped from the floor when an angry "pit-pat, pit-pat, pit-pat-pit" assailed his ear, causing him to drop the instrument as if he had been shot! It was a result none of us had expected, for it did not seem possible that the delicate metal diaphragm and the little magnet of the telephone could produce a sound so intense. Of course it was only intense when the ear was held close to the orifice of the instrument. Held in the hand away from the ear, the telephone now made a first-rate "sunder," and we could tell without difficulty not only the signals that were passing, but found in it a more comfortable tone than that given by the Morse sounder in common use.

"Other experiments of a like character led to results so similar, that they may be left unnoticed; and we proceed now to describe one of a different character, designed to test the telephone itself. At a distance of about half a mile, access was obtained to a Morse instrument in private use, and joined to the office by "overhouse" wire. Dividing our party and arranging a programme of operations, two remained with a telephone in the office, while other two, of whom the writer was one, proceeded with the second telephone to the distant instrument. By an arrangement which a practical telegraphist will understand, the key of the Morse was kept in circuit, so that signals could be exchanged in that way. It may be noticed, however, that this was hardly necessary, as the diaphragm of the telephone can be used as a key, with the finger or a blunt point, so that dot and dash signals are interchangeable, should the voice fail to be heard. As the wire in this instance travelled almost alone over part of its course, we were in hopes that induced currents would be conspicuous by their absence. In this we were, however, disappointed, for the pot was boiling away, rather more faintly, but with the "plop-plop-plop" distinctly audible, and once more a sharp masterful Morse click was heard coming in now and again. The devilly A B C was, however, absent, so that our experiment proved highly successful. For some reason or another—probably an imperfect condition of the wire, or the effects of "induction" over and above what made itself audible to us—the spoken sounds were deficient in distinctness; but songs sung at either end were very beautifully heard, and indeed the sustained note of sung words had

always a better carrying-power than rapidly spoken words. Every syllable, and every turn of melody of such a song as *My Mother bids me bind my Hair*, sung by a lady at one end, or *When the Heart of a Man*, sung at the other, could be distinctly heard, but with the effect before noticed, that the voice was muffled or shut in, as if the singer were in a cellar, while it was not always possible to say at once whether the voice was that of a man or a woman.

In the course of some domestic experiments, it was remarked that in playing the scale downwards from C in alt. on the piano, the result to the listener was a "tit" only for the four upper notes, although all below that had a clear "ting," and the octaves below were mostly distinct, although at the low notes of the piano the sound was again lost. The ringing notes of a musical box were not so successful, but with close attention, its rapid execution of *Tommy Dodd* could be well enough made out. An endeavour was made to catch the ticking of a watch, but this was not successful, and the experiment is not recommended, as the near presence of a watch to a magnet is not desirable; and the watch exposed to it in this instance was, it is thought, affected for a short time thereafter, although it received no permanent damage.

The observations made in the course of these experiments convinced those present that the telephone presents facilities for the dangerous practice of "tapping the wires," which may make it useful or dangerous, according as it is used for proper or improper purposes. It might be an important addition for a military commander to make to his flying cavalry; as an expert sound-reader, accompanying a column sent to cut off the enemy's telegraph connections, might precede the act of destruction by robbing him of some of his secrets. The rapidity and simplicity of the means by which a wire could be "milked," without being cut or put out of circuit, struck the whole of the party engaged in the various trials that are described above. Of course the process of tapping by telephone could not be carried out if the instrument in use was an A B C or single needle, or if the wire was being worked duplex or with a fast-speed Morse, for in these cases the sounds are too rapid or too indefinite to be read by ear. The danger is thus limited to ordinary sounder or Morse telegraphs; but these still form the mainstay of every public system.

Since the trials above described were made, the newspapers have recorded a beautiful application by Sir William Thomson, of the electric part of the telephone to exhibit at a distance the motions of an anemometer; the object being to shew the force of air-currents in coal-mines. This is a useful application of an electric fact, and doubtless points the way to further discoveries. But it is to be noticed that the experiment, interesting as it is, hardly comes under the head of a telephone, what is reproduced at a distance being not sound but motion.

Obviously the invention cannot rest where it is; and no one more readily than the practical telegraphist will welcome an instrument at once simple, direct, and reliable. Even in its present form the telephone may be successfully used where its wire is absolutely isolated from all other telegraph wires. But the general impression is

that its power of reproducing the sound must be intensified before its use can become general even as a substitute in works or offices for the speaking-tube.

SINGING MICE.

THESE interesting animals are said to be smaller than ordinary mice, to be usually of a brownish colour, and to have long ears. Naturalists have not come to any exact reason as to why they sing. Some persons impute the singing to disease, as in the wheezing of any one from a cold. Others attribute it to an internal parasite. But these seem unsatisfactory explanations; for when the little creatures sing they are as lively as common domestic mice. The faculty of singing in a small way with various modulations appears to be quite natural to the animals. It has been noticed that during their musical performances there is a throbbing in the throat, and that the snout is elevated in giving play to the voice, as in the warbling of birds. The song or warble of these mice is said to be sweet and varied. Hitherto not much attention has been given by zoologists to the phenomenon; but we observe by various notices in *Land and Water* and in *Nature*, two periodicals devoted to pleasant discussions on subjects of natural history, &c., that singing mice are becoming objects of careful investigation.

An amusing account of a singing mouse appears in *Nature*, Nov. 9, from the pen of Mr Joseph Sidebotham, dating from Menton, south of France.

Last winter we occupied the rooms we now do at Menton. Early in February we heard as we thought the song of a canary, and fancied it was outside our balcony; however, we soon discovered that the singing was in our *salon*, and that the songster was a mouse. At that time the weather was rather cold, and we had a little fire, and the mouse spent most of the day under the fender, where we kept it supplied with bits of biscuit. In a few days it became quite tame, and would come on the hearth in an evening and sing for several hours. Sometimes it would climb up the chifffonier and ascend a vase of flowers to drink at the water, and then sit and sing on the edge of the table and allow us to go quite near to it without ceasing its warble. One of its favourite haunts was the wood-basket, and it would often sit and sing on the edge of it. On February 12, the last night of the Carnival, we had a number of friends in our *salon*, and the little mouse sang most vigorously, much to their delight and astonishment, and was not in the least disturbed by the talking. In the evening the mouse would often run about the room and under the door into the corridor and adjoining rooms, and then return to its own hearth. After amusing us for nearly a month, it disappeared; and we suspect it was caught in a trap set in one of the rooms beyond. The mouse was small and had very large ears, which it moved about much whilst singing. The song was not unlike that of the canary in many of its trills, and it sang quite

as beautifully as any canary, but it had more variety, and some of its notes were much lower, more like those of the bullfinch. One great peculiarity was a sort of double song, which we had now and then—an air with an accompaniment. The air was loud and full, the notes being low and the accompaniment quite subdued. Some of our party were sure that there was more than one mouse, until we had the performance from the edge of the wood-basket and were within a yard or two of it. My son has suggested that many or all mice may have the same power, but that the notes are usually so much higher in the scale that, like the cry of the dormouse and the bat, they are at the verge of the pitch to which the human ear is sensitive. This may be so; but the notes of our mouse were so low, and even the highest so far within the limits of the human ear, that I am inclined to think the gift of singing in mice is but of very rare occurrence.

In the same periodical, the following additional particulars as regards singing mice are presented by Mr George J. Romanes, Regent's Park.

'Several years ago I received some of these animals from a friend, and kept them in confinement for one or two months. The description which your correspondent gives of their performance leaves very little to be added by me, as in all respects this description agrees perfectly with my own observations. I write, however, to remark one curious fact about the singing of these mice, namely, that it seemed to be evoked by two very opposite sets of conditions. When undisturbed, the little animals used for the most part to remain quiet during the day, and begin to sing at night; but if at any time they were alarmed, by handling them or otherwise, whether during the day or night, they were sure to sing vigorously. Thus the action seemed to be occasioned either by contentment or by fear. The character of the song, however, was slightly different in the two cases.

'That these mice did not learn this art from singing birds there can be no doubt, for they were captured in a house where no such birds were kept. It may be worth while to add that this house (a London one) seemed to have been suddenly invaded, so to speak, by a number of these animals, for although my friend has lived in this house since the year 1862, it was only during a few months that singing mice were heard in it, and during these few months they were heard in considerable numbers.'

As corroborative of the foregoing notices, we give the following very interesting account of a singing mouse, obligingly sent to us by a correspondent, Mr Alfred Wright.

'In the early spring of last year I was invited by an old widow lady to see a singing mouse, which she had at night heard singing and scratching beneath the floor of her bed, and been so fortunate as to catch in a trap. I went, and found the little animal in a cage with a revolving wheel, similar to that in which a squirrel is usually confined. Whether the mouse was shy at the presence of a stranger, I do not know. It remained silent; but at length, after my patience had been nearly exhausted, it began to sing in clear warbling notes like those of a bird. When I called the next evening to hear the mouse again, I heard him to perfection, and was so filled with interest in the

novelty, that I begged permission to bring any friend who was a sceptic of the fact, or who might desire to see the phenomenon. My request was readily granted. One friend of course had heard of a singing mouse, but he certainly would not allow that a prolonged squeak was a song—not he! Another friend of course had heard a mouse sing when he was a boy; but he was told, he perfectly well remembered, that the noise produced by the mouse was the result of some internal disease. Well, both of these went with me to hear the little creature. Unfortunately, at first it was again shy; but after an interval of silence it commenced to sing—sweetly, like the low notes, the jug, of the nightingale. My friends had come, had heard, and were conquered! The one acknowledged it was really a song and not a squeak; the other, that the noise was certainly dulcet; but still he thought it possibly might be the result of disease, and not natural to the little animal. We suggested that this wonderful natural curiosity (as we deemed it) should be sent to an eminent naturalist who resided near. Great, therefore, was my astonishment and pleasure when it was presented to me, who could only treat it like a schoolboy would his white mouse—as a pet. And truly it became a great pet to both my wife and myself.

'In form, the singing mouse did not differ from his humbler brethren; but in colour he was of a darkish brown, and had very bright eyes. It soon became used to the presence of my wife, and sang constantly while revolving the wheel of his cage. The notes proceeded from the throat. He became exceedingly gentle, and was pleased at being caressed.

'I deemed him so rare a curiosity that I ventured to offer to exhibit him to the distinguished naturalist referred to above, and in my letter described the little creature and its peculiarities, as I have done here. The naturalist most courteously replied: "The case of the singing mouse is very extraordinary, but the fact is now well established. . . . The best account which has ever been published is by an American naturalist, and I have given an abstract of his account in my *Descent of Man*."

"The American referred to is the Rev. S. Lockwood, author of *The American Naturalist*, and he gives an account of his observations of the *Hesperomys cognatus*, an American species, belonging to a genus distinct from that of the English mouse. This little animal gave two chief songs. Mr Lockwood gives both songs in musical notation; and adds, that though this mouse 'had no ear for time,' yet she would keep to the key of B (two flats) and strictly in the major key. . . . Her soft clear voice falls an octave with all the precision possible; then at the wind up it rises again into a very quick trill in C sharp and D." I have made this quotation, as it far better describes the peculiar qualifications of a singing mouse, than my inexperienced observations could announce.

'My mouse remained in contented confinement upwards of a year, feeding upon a little sopped bread and canary-seed; and great was the grief of my wife (who was his keeper) and myself when he was found dead in his little nest. During the previous evening he had been heard singing with more than usual ardour.'

We shall probably return to this interesting subject.

USING UP WASTE SUBSTANCES.

THE subject denoted by the above title, more than once treated in the *Journal*, is adverted to by an obliging Lancashire correspondent who, surrounded by one of the busiest and most ingenious clusters of townsmen in England, has had his attention drawn to various substances waiting (as it were), for application to useful purposes. His suggestions are not wholly new, having to some extent been already anticipated; but they are sufficiently valuable to call for notice here.

One relates to the waste that presents itself in the processes of manufacturing cotton. A residue known technically as *willowings*, that falls into a receptacle during the preparatory beating and disentangling of raw cotton-wool, consists of a dusty heap of seed-husks and short broken fibres. It is used by farmers to absorb the liquid manure of their cowsheds and middens or dung-heaps. Although some of the cottony fibre may be separated through a sieve, so much adheres to the seed-husk as to render it unsuitable for paper-making, for which it has often been tried. The suggestion now made is, that though unfitted for paper, this refuse may possibly be found useful in the manufacture of *millboard*. Large quantities of this tough and durable product are employed for bookbinding, for making the discs of railway wheels, &c.; and as colour is not a matter of moment, the idea is that the mingled residue of cottony fibre and seed-husk might be rendered available. It is known that millboard made from wood-pulp is imported to a considerable extent from abroad; and we are told that 'a large portion of the private income of the great German Chancellor Prince Bismarck is derived from the manufacture of wood-millboard on his Varzin estate.' Many hundred tons of willowings could be obtained in Lancashire at a very cheap rate, even as low as two shillings per hundredweight.

Another suggestion bears relation to the utilisation of refuse from the manufacture of prussiate of potash, a most valuable product in the hands of the manufacturing chemist. The prussiate is obtained in large ratio from woollen rags, after the separation of all the pieces that can be worked up into shoddy for cheap cloth. The refuse is calcined in cast-iron retorts, lixiviated with water, and drained off for subsequent treatment: leaving behind it a thick black sediment of impure animal charcoal. The suggestion relates to the application of this residue to the manufacture of blacking—a humble but valuable agent for those who appreciate tidiness in the appearance of boots and shoes and economy in the preservation of leather. If useful for this purpose, it might be found advantageous and economical as an ingredient in printers' ink. Whether this carbon residue is at present applied to any other useful purpose, we are not fully informed.

A third suggestion relates to the preparation of animal size for the carpet-manufacture and for that of many kinds of woollen and worsted goods. This size is made from the clippings and scrapings of skins and hides, from rejected scraps of parchment and vellum, and from the worn-out buffalo skin pickers and skips largely used in textile manufactures; also from the pith of cattle-horns, which contain a large amount of valuable gelatine. The suggestion is, to utilise the refuse left after

making this size. One large carpet factory in Yorkshire rejects as utterly useless a ton or more of this refuse every week. The horn-pith contains as one of its components phosphate of lime, and is on that account recommended to the notice of the manufacturers of chemical manures on a large scale.

One more suggestion comes from our ingenious correspondent. Old corks are applicable to a greater number of purposes than we are generally in the habit of supposing. That many of them are ground up to make cork-stuffing for cushions, padding, &c. is well known; but there are other uses for them as corks or half corks, besides making floating buoys and life-preservers. A taverner in a Lancashire town covered the floor of his lobby and bar with very open rope-matting, and filled up the openings with old corks cut down to the level of the surface of the mats. This combination is found to be almost indestructible under the feet; while it gives a good grip or foothold. As the making of rope-mats is one of the trades carried on in reformatories and some other large establishments, it is suggested that the managers should take into consideration the feasibility of adding old corks to their store of manufacturing materials.

As this *Journal* finds its way into every corner of the busy hives of industry, it may possibly be that some of our readers are already acquainted with such applications of waste refuse to useful purposes as those which our esteemed correspondent suggests. But this is a point of minor importance. The primary question is, not whether an idea is absolutely new, but whether it is practically susceptible of useful application. The history of manufactures teaches us that apparently humble trifles like these have proved to be worth millions sterling to the country.

LET BYGONES BE BYGONES.

Let bygones be bygones; if bygones were clouded

By aught that occasioned a pang of regret,

Oh, let them in darkest oblivion be shrouded;

'Tis wise and 'tis kind to forgive and forget.

Let bygones be bygones, and good be extracted

From ill over which it is folly to fret;

The wisest of mortals have foolishly acted—

The kindest are those who forgive and forget.

Let bygones be bygones; oh, cherish no longer

The thought that the sun of Affection has set;

Eclipsed for a moment, its rays will be stronger,

If you, like a Christian, forgive and forget.

Let bygones be bygones; your heart will be lighter,

When kindness of yours with reception has met;

The flame of your love will be purer and brighter

If, Godlike, you strive to forgive and forget.

Let bygones be bygones; oh, purge out the leaven

Of malice, and try an example to set

To others, who craving the mercy of heaven,

Are sadly too slow to forgive and forget.

Let bygones be bygones; remember how deeply

To heaven's forbearance we all are in debt;

They value God's infinite goodness too cheaply

Who heed not the precept, 'Forgive and forget.'

THE ROMANCE OF ACCIDENT.

MANY of our most important inventions and discoveries owe their origin to the most trivial circumstances; from the simplest causes the most important effects have ensued. The following are a few culled at random for the amusement of our readers.

The trial of two robbers before the Court of Assizes of the Basses-Pyrénées accidentally led to a most interesting archaeological discovery. The accused, Rivas a shoemaker, and Bellier a weaver, by armed attacks on the highways and frequent burglaries, had spread terror around the neighbourhood of Sisteron. The evidence against them was clear; but no traces could be obtained of the plunder, until one of the men gave a clue to the mystery. Rivas in his youth had been a shepherd-boy near that place, and knew the legend of the Trou d'Argent, a cavern on one of the mountains with sides so precipitous as to be almost inaccessible, and which no one was ever known to have reached. The Commissary of Police of Sisteron, after extraordinary labour, succeeded in scaling the mountain, and penetrated to the mysterious grotto, where he discovered an enormous quantity of plunder of every description. The way having been once found, the vast cavern was afterwards explored by *savants*; and their researches brought to light a number of Roman medals of the third century, flint hatchets, ornamented pottery, and the remains of ruminants of enormous size. These interesting discoveries, however, obtained no indulgence for the accused (inadvertent) pioneers of science, who were sentenced to twenty years' hard labour.

The discovery of gold in Nevada was made by some Mormon immigrants in 1850. Adventurers crossed the Sierras and set up their sluice-boxes in the cañons; but it was gold they were after, and they never suspected the existence of silver, nor knew it when they saw it. The bluish stuff which was so abundant and which was silver ore, interfered with their operations and gave them the greatest annoyance. Two

brothers named Grosch possessed more intelligence than their fellow-workers, and were the real discoverers of the Comstock lode; but one of them died from a pickaxe wound in the foot, and the other was frozen to death in the mountains. Their secret died with them. When at last, in the early part of 1859, the surface croppings of the lode were found, they were worked for the gold they contained, and the silver was thrown out as being worthless. Yet this lode since 1860 has yielded a large proportion of all the silver produced throughout the world. The silver mines of Potosi were discovered through the trivial circumstance of an Indian accidentally pulling up a shrub, to the roots of which were attached some particles of the precious metal.

During the Thirty Years' War in Germany, the little village of Coserow in the island of Usedom, on the Prussian border of the Baltic, was sacked by the contending armies, the villagers escaping to the hills to save their lives. Among them was a simple pastor named Schwerdler, and his pretty daughter Mary. When the danger was over, the villagers found themselves without houses, food, or money. One day, we are told, Mary went up the Streckelberg to gather blackberries; but soon afterwards she ran back joyous and breathless to her father, with two shining pieces of amber each of very great size. She told her father that near the shore the wind had blown away the sand from a vein of amber; that she straightway broke off these pieces with a stick; that there was an ample store of the precious substance; and that she had covered it over to conceal her secret. The amber brought money, food, clothing, and comfort; but those were superstitious times, and a legend goes that poor Mary was burned for witchcraft. At the village of Stumen, amber was first accidentally found by a rustic who was fortunate enough to turn some up with his plough.

Accidents have prevented as well as caused the working of mines. At the moment that workmen were about to commence operations on a rich gold mine in the Japanese province of Tsungko,

a violent storm of thunder and lightning burst over them, and the miners were obliged to seek shelter elsewhere. These superstitious people, imagining that the tutelar god and protector of the spot, unwilling to have the bowels of the earth thus rifled, had raised the storm to make them sensible of his displeasure, desisted from all further attempts to work the mine.

A cooper in Carniola having one evening placed a new tub under a dropping spring, in order to try if it would hold water, when he came in the morning found it so heavy that he could hardly move it. At first, the superstitious notions that are apt to possess the minds of the ignorant made him suspect that his tub was bewitched; but at last perceiving a shining fluid at the bottom, he went to Laubach, and shewed it to an apothecary, who immediately dismissed him with a small gratuity, and bid him bring some more of the same stuff whenever he could meet with it. This the poor cooper frequently did, being highly pleased with his good fortune; till at length the affair being made public, several persons formed themselves into a society in order to search farther into the quicksilver deposits, thus so unexpectedly discovered, and which were destined to become the richest of their kind in Europe.

Curious discoveries by ploughmen, quarrymen, and others of caves, coins, urns, and other interesting things, would fill volumes. Many valuable literary relics have been preserved by curious accidents, often turning up just in time to save them from crumbling to pieces. Not only mineral but literary treasures have been brought to light when excavating mother earth. For instance, in the foundations of an old house, Luther's *Table Talk* was discovered 'lying in a deep obscure hole, wrapped in strong linen cloth, which was waxed all over with beeswax within and without.' There it had remained hidden ever since its suppression by Pope Gregory XIII. The poems of Propertius, a Roman poet, long lurked unsuspected in the darkness of a wine-cellar, from whence they were at length unearthed by accident, just in time to preserve them from destruction by rats and mildew. Not only from beneath our feet but from above our heads may chance reveal the hiding-places of treasure-trove. The sudden falling in of a ceiling, for example, of some chambers in Lincoln's Inn revealed the secret depository of the Thurloe state papers. Other literary treasures have turned up in an equally curious manner. Milton's essay on the *Doctrines of Christianity* was discovered in a bundle of old despatches: a monk found the only manuscript of Tacitus accidentally in Westphalia: the letters of Lady Mary Montagu were brought to light from the recesses of an old trunk: the manuscripts of Dr Dee from the secret drawer of an old chest: and it is said that one of the cantos of Dante's great poem was found, after being long mislaid, hidden away beneath a window-sill.

It is curious to trace how the origin of some famous work has been suggested apparently by the merest accident. We need but remind the reader how Lady Austen's suggestion of 'the sofa' as a subject for blank verse was the beginning of *The Task*, a poem which grew to formidable proportions under Cowper's facile pen. Another example of

What great events from trivial causes spring,

is furnished by Lockhart's account of the gradual growth of *The Lay of the Last Minstrel*. The lovely Countess of Dalkeith hears a wild legend of Border *diablerie*, and sportively asks Scott to make it the subject of a ballad. The poet's accidental confinement in the midst of a yeomanry camp gave him leisure to meditate his theme to the sound of the bugle; suddenly there flashes on him the idea of extending his simple outline so as to embrace a vivid panorama of that old Border life of war and tumult. A friend's suggestion led to the arrangement and framework of the *Lay* and the conception of the ancient Harper. Thus step by step grew the poem that first made its author famous. The manuscript of *Waverley* lay hidden away in an old cabinet for years before the public were aware of its existence. In the words of the Great Unknown: 'I had written the greater part of the first volume and sketched other passages, when I mislaid the manuscript; and only found it by the merest accident, as I was rummaging the drawer of an old cabinet; and I took the fancy of finishing it.'

Charlotte Brontë's chance discovery of a manuscript volume of verses in her sister Emily's handwriting led, from a mutual confession of the *furor poeticus*, to the joint publication of their poems, which though adding little to their subsequent fame, at least gives us another instance of how much of what is called chance has often to do with the carrying out of literary projects. It was the burning of Drury Lane Theatre that led to the production of *The Rejected Addresses*, the success of which, says one of the authors, 'decided him to embark in that literary career, which the favour of the novel-reading world rendered both pleasant and profitable to him.' Most of us know how that famous fairy tale *Alice in Wonderland* came to be written. The characters in *Oliver Twist* of Fagin, Sikes, and Nancy were suggested by some sketches of Cruikshank, who long had a design to shew the life of a London thief by a series of drawings. Dickens, while paying Cruikshank a visit, happened to turn over some sketches in a portfolio. When he came to that one which represents Fagin in the condemned cell, he studied it for half an hour, and told his friend that he was tempted to change the whole plot of his story, not to carry Oliver through adventures in the country, but to take him up into the thieves' den in London, shew what this life was, and bring Oliver through it without sin or shame. Cruikshank consented to let Dickens write up to as many of the drawings as he thought would suit his purpose. So the story as it now runs resulted in a great measure from that chance inspection of the artist's portfolio. The remarkable picture of the Jew malefactor in the condemned cell biting his nails in the torture of remorse, is associated with a happy accident. The artist had been labouring at the subject for several days, and thought the task hopeless; when sitting up in his bed one morning with his hand on his chin and his fingers in his mouth, the whole attitude expressive of despair, he saw his face in the cheval glass. 'That's it!' he exclaimed; 'that's the expression I want.' And he soon finished the picture.

The sudden prosperity of many a famous painter has resulted from some fortunate accident. Anthony Watteau, when a nameless struggling artist, timidly offered a painting to a rich picture-

dealer for six francs, and was on the eve of being scornfully rejected, had not a stranger, who happened to be in the shop, come forward, and seeing some talent in the work, spoke encouragingly to the youth, and offered him one hundred and fifty francs for the picture; nor was this all, for he became Watteau's patron and instructor.—One day a little shepherd-boy was seated near the road-side on the way from Vespignano to Florence drawing upon a polished stone, his only pencil another polished stone which he held in his tiny fingers. A richly dressed stranger, who had descended from a conveyance that was following him, chanced to pass, and looking over the boy's shoulder, saw that he had just sketched with wonderful truth and correctness a sheep and its twin lambs. Surprised and pleased, he examined the face of the young artist. Certainly it was not its beauty that attracted him. The child looked up, but with such a marvellous light in his dark eyes, that the stranger exclaimed: 'My child, you must come with me; I will be your master and your father: it is some good angel that has led me here.' The stranger was Cimabue, the most celebrated painter of that day; and his pupil and protégé became the famous painter, sculptor, and architect (Giotto), the friend and admiration of Dante and Petrarch.

How the fortunes of painters may hinge upon the most trifling circumstances, has another example in that of Ribera or Spagnoletto, which was determined by a very simple incident. He went to reside with his father-in-law, whose house, it so happened, stood in the vast square one side of which was occupied by the palace of the Spanish Viceroy. It was the custom in Italy, as formerly amongst the Greeks, that whenever an artist had completed any great work, he should expose it in some street or thoroughfare, for the public to pass judgment on it. In compliance with this usage, Ribera's father-in-law placed in his balcony the 'Martyrdom of St Bartholomew' as soon as it was finished. The people flocked in crowds to see it, and testified their admiration by deafening shouts of applause. These acclamations reached the ears of the Viceroy, who imagined that a fresh revolt had broken out, and rushed in complete armour to the spot. There he beheld in the painting the cause of so much tumult. The Viceroy desired to see the man who had distinguished himself by so marvellous a production; and his interest in the painter was not lessened on discovering that he was, like himself, a Spaniard. He immediately attached Spagnoletto to his person, gave him an apartment in his palace, and proved a generous patron ever afterwards.

Lanfranco, the wealthy and munificent artist, on his way from the church Il Gesù, happened to observe an oil-painting hanging outside a picture-broker's shop. Lanfranco stopped his carriage, and desired the picture to be brought to him. Wiping the thick dust from the canvas, the delighted broker brought it, with many bows and apologies, to the great master, who on nearer inspection saw that his first glance had been correct. The picture was labelled 'Hagar and her Son Ishmael dying of Thirst,' and the subject was treated in a new and powerful manner. Lanfranco looked for the name of the painter, and detecting the word Salvatoriello modestly set in a corner of the picture, he gave instructions to his pupils to

buy up every work of Salvatoriello they could find in Naples. To this accident Salvator owed the sudden demand for his pictures, which changed his poverty and depression into comparative ease and satisfaction.

More than one famous singer might probably never have been heard of but for some discriminating patron chancing to hear a beautiful voice, perhaps exercised in the streets for the pence of the compassionate.—Some happy stage-hits have resulted from or originated in accidents. The odd hop skip and jump so effective in the delineation of Dundreary, says an American interviewer of Mr Sothorn, was brought about in this way. In the words of the actor: 'It was a mere accident. I have naturally an elastic disposition, and during a rehearsal one cold morning I was hopping at the back of the stage, when Miss Keene sarcastically inquired if I was going to introduce that into Dundreary. The actors and actresses standing around laughed; and taking the cue, I replied: "Yes, Miss Keene; that's my view of the character." Having said this, I was bound to stick to it; and as I progressed with the rehearsal, I found that the whole company, including scene-shifters and property-men, were roaring with laughter at my infernal nonsense. When I saw that the public accepted the satire, I toned down what was a broad caricature to what can be seen at the present day by any one who has a quick sense of the absurd.'

An excellent landscape of Salvator Rosa's exhibited at the British Institution in 1823 came to be painted in a curious way. The painter happened one day to be amusing himself by tuning an old harpsichord; some one observed they were surprised he could take so much trouble with an instrument that was not worth a crown. 'I bet you I make it worth a thousand before I have done with it!' cried Rosa. The bet was taken; and Salvator painted on the harpsichord a landscape that not only sold for a thousand crowns, but was esteemed a first-rate painting.—Chemistry and pathology are indebted to what has often seemed the merest chance for many of important discovery. A French paper says it has been accidentally discovered that in cases of epileptic fits, a black silk handkerchief thrown over the afflicted persons will restore them immediately. Advances in science and art and sudden success in professions have often more to do with the romance of accident than most people imagine; but as we may have occasion again to take up the subject, we quit it for the present.

A DIFFICULT QUESTION.

THE STORY OF TWO CHRISTMAS EVES.

IN TWO CHAPTERS.

CHAPTER II.—ANSWERED.

THE mistletoe hung from the chandelier, the holly wreaths were on the walls, the clear fire shed a warm glow through the dimly lighted room, upon pictures and gilding, upon a great vase filled with crimson camellias, upon Ralph Lorraine's dark handsome face. Christmas eve again, his first year in England over. How little certainty there is in this world; when we think we have smoothed our path, and see our way straight before us, there

rises up some roughness, some unevenness we have left unnoticed, or thought too small to trouble us. So with Ralph, he had answered the question he asked himself last Christmas eve by another; he was very happy, but he was thinking now as he leaned against the mantel-piece whether he could bear to leave the army and give up the life he had led for so long; the life, at times one of bold daring, at others of lazy pleasure, which had suited him so well; that even now, with the wish of his heart fulfilled, it cost him a struggle to bid farewell to it, and to settle down into a quiet country gentleman. He had kept his oath to his dead friend, the oath he had taken in answer to the faintly spoken words, 'I meant to have made her so happy.' Louise would remain in her old home as its mistress.

It had been a happy year to Ralph, and had glided away so quickly since that first night when he had seen her standing in the snowy churchyard, listening to words which sounded very much like love from another man's lips. That other had, however, confirmed his opinion. Vere Leveson had been away with his regiment during all the twelve months; not once had he met Louise; the field had been clear for Ralph. Yet it was only a week since he had spoken; he had not dared at first to break through the barrier of childish affection. She looked upon him as her guardian, her father's friend, with the same grateful reverence she might have given to that father had he lived; so he had tried very gently to awaken deeper feelings, through the sweet early spring-time and the glowing summer days, till when the leaves were lying in brown showers upon the sodden earth, she had grown silent, shy, and distant, and so cold that he thought all hope was gone. He went away in November; and when he returned, his love unspoken became torture to his upright nature; he could not bear to live there day by day, to see her so often, to let her kiss him as a daughter might have done, and all the while that hidden passion burning in his heart. But after his temporary absence she had changed again; she was more as she had been, gentle, playfully loving; and so one day he had spoken. He told her of her dying father's words; how his great wish had been that she should never feel the loss he had caused her; how her happiness was his first object in life; and how that life would be indeed worthless and barren, should he go back to it alone. Grateful, she answered as he wished, and Ralph held in his arms as his betrothed wife the child he had promised to watch over in the silence of the Indian dawn.

'But you must give me time,' she had said timidly. 'I have never thought of you but as my guardian, Ralph.' She dropped the name of her childhood then, as a tacit acknowledgment that those days were over, and that she would learn to love him henceforth, not with a child's grateful unquestioning love, but with the tenderness of a wife.

She was the only one surprised by the event; all the neighbourhood had known it long before; so had Mrs Loraine and Emma; so had Katharine, whose wedding-day was now approaching, and whose bridegroom was Sir Michael Leyland. The drawing-room door opened, and Louise entered into the uncertain light, wearing the dress he had chosen for her—white bridal-looking silk, and holly wreaths like those she had worn last year.

She went up to him composedly, with none of a young fiancée's usual bashfulness.

'Do you like my dress, Ralph?' she said, looking up with her sweet dark eyes, as he bent down and touched the rosy lips.

'I do,' he answered. 'You are always lovely, darling; last year I thought the same, but then things were different. I did not dare to hope for such happiness as this.'

'Are you happy, Ralph?'

'Happier than I have ever been in my whole life,' he whispered.

Then the others came in, and they started for the annual ball at Leigh Park. Vere Leveson had returned a week ago; and as he stood among his father's guests there was a troubled look on his face which deepened ever as the white silk folds of the holly-wreathed dress brushed past him, or the dark eyes watching its wearer met hers. At last he went to her.

'Are you engaged for this, Miss Wrayworth?' he said abruptly.

'No,' she answered.

'Then you will give it to me?'

Once more he held her in his arms, once more her hand rested in his, as they glided slowly round the room. Vere did not speak till the waltz was ended, and then he led her to the same window where they had stood a year ago. The same stars were shining down on the same world, only that night there was no snow-shroud over the dead flowers, and the moon was half hidden by a great splash of cloud. The same first faint Christmas bells were sounding in the distance, mingled with the echoes of a carol sung by boys' clear voices, telling for the angels the old story they had told so long ago.

'I wish you a merry Christmas,' Vere said, looking down on her with a half-scornful smile. 'What mockery there is in that salutation sometimes. If you were to say it to me, for instance.'

'Indeed I hope you will have one,' she answered timidly.

'I must go a long way to find it then,' he muttered. 'But I beg your pardon, Miss Wrayworth; I must congratulate you. I met—your sister I was going to say—Miss Loraine I mean, as I was on my way to call upon you the other day, and she told me of your engagement.'

'But you did not come,' said Louise.

'No; I thought you would be occupied. I congratulate you,' he repeated.

'Thank you,' she answered very low.

'Major Loraine is completely calculated to make a wife happy, I should think,' said Vere, in the same cold scornful tone.

She lifted her head quickly. 'Indeed he is; he is the best, noblest, most generous man that breathes!'

'And you love him?'

'He has been everything to me all my life long, Mr Leveson—father, brother, friend. Would you not have me do what I can to prove my gratitude?'

'By making him a still nearer relation? Certainly. But for my part, there is one thing I should rather choose my wife to feel for me than gratitude. How everything changes in this world!' he added abruptly. 'Can it possibly be only one year since I stood at this same window with a girl by my side who promised to remember me and

trust me till next Christmas? Such a short time! only twelve little months. I suppose it is true that

Woman's love is writ in water,
Woman's faith is traced on sand.

But I never believed it.

'I hope you will not find it so,' said the girl softly, as she played nervously with the shining holly leaves, breaking them, and crushing the scarlet berries till they fell spoiled upon the floor. 'I must congratulate you.'

'I beg your pardon! Congratulate me! What upon?'

'Your—your engagement.'

'My engagement! And may I ask to whom?'

'To Miss Leslie.'

'What!' he exclaimed. 'What do you mean? Alice Leslie! Who can have told you such a falsehood?'

'Katharine heard it when she was in London.'

There was a long long silence, while each guessed the other's secret.

'Is it not true?' she said at last.

'No; on my soul!' he answered. 'I never said a word to that girl all the world might not have heard. I engaged to her! No! O Louise!' he cried passionately; 'Louise, my darling! I have loved you so long, and this is the end of it! Did not you know last year that I loved you and you only, when I asked you to trust me? I have been silent for a year, to obey my father, and—I have lost you!'

His voice trembled as he caught her hands, and a great longing tenderness gleamed in his deep blue eyes. 'Did not you love me, Louise? Have I been fool enough to delude myself all these months?'

'I was very—very unhappy when Katharine told me.' The answer was simply, hopelessly spoken, and there was another silence, broken again by her voice. 'Vere,' she said, 'Vere—I may call you so just this once—we have made a terrible mistake; but I must keep my word. Say good-bye to me, and let me go.'

'Oh, my darling! my darling!'

'Hush! Vere, hush!' she said brokenly. 'I owe him a debt nothing can ever pay; and I know he will keep the promise he made to my father years ago, to try and make me happy.'

'God helping me, I will!' It was Ralph Loraine's voice that spoke; Ralph Loraine's dark fearless eyes that rested upon her; Ralph Loraine's loyal hand which took her cold one, as she started back from the man she loved.

'Don't look frightened, dear,' he said gently. 'Poor child, how you must have suffered! Louise! do you think I would let you bear one moment's pain to save myself from a lifetime of misery? Forgive me, dear; the dream has been very bright, and the awaking is—he paused for a moment and steadied his voice—a little hard; but I shall soon be used to it. The vow I made to your dead father, I will still keep, Louise; I am your guardian, nothing more. Forget what has been between us, child, as soon as you can.' He turned, and held out his hand to Vere. 'It is a precious charge I give up to you,' he said solemnly; 'you must help me to keep my vow.' He paused, then added tremulously: 'You must make her happy for me.' Then without another word he passed out through

the open window into the wintry moonlit garden, and left them alone.

He wandered down the avenue through the open gate among the waiting carriages on to the silent fields, bearing the sorrow bravely, the utter wreck of his life's sweetest hopes. 'Which is the harder,' he thought bitterly as he hurried on, scarcely knowing where he went, 'to lay down life or love?' In his great unselfishness he never blamed her who had wrought this trouble; he had vowed to make her happy; he had done his duty, nothing more, but it was hard to do. It had been a fearful temptation as he listened, to go away without speaking, and so keep her his; but he had conquered. Yet it seemed as though he could not live without her, as though that one happy week had swallowed up his whole existence, as though he had loved all his life instead of for one short year; and he looked up piteously to the cloudy heavens, to the wintry moon, seeking for the comfort that was not to be found, longing, in his wretchedness, to lie down upon the cold wet grass and sleep never to wake again.

'Won't you remember the carols?'

A shrill voice broke in upon his thoughts; he started, looking down suddenly, vacantly, as though he did not comprehend.

Two boys stood there, on their way home across the fields. 'Hush!' said the elder; 'don't you see it's the Major? Merry Christmas, sir!'

Ah! how mockingly those words sounded now. The greeting stung him as the taunt of a fiend; he turned and hurried on. He paused breathlessly at the stile leading into the next field; all his strength seemed to have left him as he stood there alone with his grief. Then from the distance was wafted to him the sound of the boys' voices, and the words they sung were these:

All glory be to God on high,
And to the earth be peace;
Good-will henceforth from heaven to men
Begin and never cease!

Somehow they comforted him as no human sympathy could have done—the grand old words, the simple tune, the children's voices. Though he did not know that by what he had done that night, he had fulfilled as far as might be the charge given in the angels' song.

A DREAM AND ITS CONSEQUENCES.

WHEN I was about twelve years of age I was invited by Mrs Hall, my god-mother, to pay her a visit before going to a boarding-school, where I was to remain for a few years. My mother had died when I was very young; and my father thought it better for me to be at a nice school, where I would be amongst girls of my own age, than in the house with only his sister and himself. Mrs Hall was very fond of me; she had no children of her own; and had my father consented, she and Mr Hall would have taken me to live with them entirely.

It was a lovely day in June when I arrived at my god-mother's; and she was delighted to see me. The house was beautifully situated on high ground, surrounded by grand old trees, and at one side was a flower-garden.

One morning god-mother said to me: 'Come upstairs with me, Lilian, and I will shew you some

Indian jewels that my uncle left me lately.' She opened the drawer of an inlaid sandal-wood cabinet and took out a small case, in which were a pair of ear-rings, a brooch, and necklet of most beautiful diamonds. I thought I had never seen anything so beautiful before. 'My dear Lilian,' said she, 'I intend to give you these on your sixteenth birthday. I see, however, there is a stone loose in one of the ear-rings, so I will take it into town to-day and have it repaired.' She folded it up carefully and put it in her purse; the case with the other diamonds she put in one of the drawers of her dressing-glass.

After lunch, Mr and Mrs Hall took me with them to the town, which was about four miles distant. The ear-ring was left at the jeweller's, and as we were to spend the day at a friend's house, we arranged to call for it on our way back. But you will say what has all this to do with your dream? Well, wait a little and you will see.

We spent a pleasant day, called for the ear-ring on our way, and arrived home about half-past nine o'clock. As I was taking off my bonnet, god-mother came into the room. 'Lilian,' said she, 'I cannot find the case of diamonds anywhere. Did I not leave it in the drawer in my dressing-glass, before I went out? I went to put in the other ear-ring now, and it was not there. Who can have taken it?'

'You certainly left it in the dressing-glass drawer,' I said. 'Could any of the servants have taken it, do you think?'

'I am sure they would not,' she answered. 'I have had them with me for years, and never missed anything before.'

'Are there any strangers about that could have come in through the window?'

'No, Lilian; there are no strangers about the place except the gardener, and he seems a most respectable man. I got a very high character of him from his last place; in fact we were told he was a most trustworthy person.'

Next day there was a wonderful commotion about the missing jewel-case. The police were sent for, and every place was searched over and over again, but to no purpose. One thing, however, puzzled us: on the window-sill was a foot-mark, and near the dressing-table a little bit of earth, as if off a shoe or boot; which led us to think that the thief must have come in through the window. But how did he get up to it? It was a good height from the ground, and the creeping plants were not in the least broken, as would have been the case had any one climbed up by them. A ladder must have been employed; and it was little to the credit of the police that this fact had not been properly considered. As the matter stood, it was a mystery, and seemed likely to remain so, and only one ear-ring was left of the valuable set.

In a few days I left for school, where I remained for four years. I spent every vacation between my home and my god-mother's. We often spoke of the stolen diamonds; but nothing had ever been heard of them, though a reward of fifty pounds had been offered by Mr Hall for any information that would lead to the detection of the thief. On my sixteenth birthday my god-mother gave me a beautiful watch and chain and the diamond ear-ring, which she had got arranged as a necklet.

'I am so sorry, Lilian,' said she, 'that I have

not the rest of those diamonds to give you; but if ever they are found, they shall be yours, my dear.'

I must now pass over six years, which went by quietly and happily, nothing very important taking place until the last year, during which time I had been married. My husband was a barrister. We lived in the north of England. My mother-in-law Mrs Benson, and Mary, one of her daughters, lived some miles away from us near the sea-coast. It was a very lonely place, a long way from the little fishing-town, or rather village, of Burnley. I confess I often felt very nervous about Mrs Benson and her daughter living alone (her husband being dead many years). Except three women-servants in the house, and the coachman and his family who lived in the lodge, there was no one nearer than Burnley, four miles off. Besides, it was known that there was a large quantity of plate in the house; and the little sea-side village was often the resort of smugglers and other wild and lawless characters. One day, while thinking of them, I felt so uneasy that I said to my husband: 'I hope, Henry, there is nothing wrong with your mother; she has been in my mind all day.'

'Oh,' said he, 'why should you feel anxious about her to-day? I saw her last Tuesday; and if she were ill, Mary would be sure to let us know. It is only one of your "fancies," little wife.'

Still I did not feel easy, for more than once before my so-called 'fancy' had proved to be a 'reality'; so I determined that in a few days I would go and see Mrs Benson. All that evening I could not get her out of my thoughts, and it was a long time before I went to sleep. I think it must have been about three o'clock in the morning that I woke in a state of terror. I had dreamed that I saw Mrs Benson standing in the window of her bedroom, beckoning me to come to her, and pointing to a female figure who was stealing along under the shade of the trees in the avenue, for the moon was shining brightly.

I started up, thinking I heard her calling me. And here is the most extraordinary part of it all—though I was now quite awake, I heard, as I thought, a voice saying to me: 'Go, tell Mrs Benson, Martha is deceiving her; tell her to send her away at once.'

Three times these words seemed to be repeated in my ear. I can't describe exactly what the voice was like: it was not loud, but quite distinct; and I felt as I listened that it was a warning, and that I *must* obey it. I woke my husband, and told him my dream and the words I had heard. He tried to calm my mind, and evidently thought me foolish to be so frightened by only a stupid dream. I said I would drive over the first thing after breakfast, and see if anything was wrong with Mary or her mother. The only thing that puzzled me was that Martha should be mentioned as deceiving Mrs Benson. She acted as housekeeper and lady's-maid to her, and was believed to be most trustworthy in every way. She had been four years with her; and was much respected. She was a silent reserved kind of person, about thirty-five years of age. One thing I had often remarked about her was, that when speaking to any one she never looked straight at them; but I thought it might be from a kind of shyness more than anything else.

As soon as breakfast was over I set off, telling my husband I would very likely not return until

next day ; and if possible, he was to come for me. He could drive over early and spend the day ; and we would return home together in the evening, if all was well with his mother.

When I arrived I found Mrs Benson and Mary looking as well as ever, and everything seemingly just as usual. Martha was sitting at work in her little room, which opened off Mrs Benson's dressing-room. I could not help looking at her more closely than I would have done at another time, and I thought I saw a look of displeasure cross her face at seeing me. Mary and her mother were of course delighted to see me, and asked why Henry did not come too. So I told them I would stay till the next day, if they would have me, and Henry would come for me then. They were quite pleased at that arrangement ; for it was not very often my husband could spend a whole day with them.

As the day passed on and nothing out of the way happened, I began to think I had frightened myself needlessly, and that my dream or vision might have been the result of an over-anxious mind. And then Martha, what about her ? Altogether I was perplexed. I did not know what to think ; but I still felt a certain undefined uneasiness. I offered up a silent prayer to be directed to do right, and determined to wait patiently and do nothing for a while. I almost hoped I might hear the voice again, giving me definite instructions how to act. Lunch passed and dinner also ; and the evening being very warm, for it was the middle of July, we sat at the open window enjoying the cooling breeze that set in from the sea.

As they were early people, shortly after ten o'clock we said 'good-night,' and went up to our bedrooms. My room looked on the avenue, some parts of which were in deep shade, while in other parts the moonlight shone brightly through breaks in the trees. I did not feel in the least sleepy ; and putting out my candle, I sat by the window, looking at the lovely view ; for I could see the coast quite plainly, and the distant sea glistened like silver in the moonlight. I did not think how long I had been sitting there, until I heard the hall clock strike twelve. Just then I heard, as I thought, a footstep outside my door, which evidently stopped there, and then in a few seconds passed on. I did not mind, thinking it might be one of the servants, who had been up later than usual, and was now going quietly to bed. I began to undress, not lighting the candle again, as I had light enough from the moon. As I came towards the window to close it, I saw, exactly as in my dream, a female figure—evidently keeping in the shade of the trees—going down the avenue. I determined to follow and see who it was, for I now felt the warning voice was not sent to me for nothing, and I seemed to get courage, girl though I was, to fathom the mystery. I hastily dressed, threw a dark shawl over my head, and going noiselessly down-stairs, opened the glass door in the drawing-room window, and left it so that I could come in again. I kept in the shade of the trees as much as possible, and quickly followed the path I had seen the woman take. Presently I heard voices ; one was a man's, the other a woman's. But who was she ? I came close, and got behind a large group of thick shrubs. I could now see and hear them quite well ; they were

standing in the light ; I was in deep shade. Just then the woman turned her head towards me. It was *Martha* ! What did she want there at that hour ? And who was this man ? I was puzzled. Where had I seen that face before ? for that I *had* seen it before, I was certain ; but where, and when, I could not remember. He was speaking in a low voice, and I did not hear very distinctly what he said, but the last few words were : 'And why not to-night ? Delays are always dangerous, especially now, as they are beginning to suspect me.'

'Because Mrs Benson's daughter-in-law is here, and she is sleeping in the room over the plate-closet, and would be sure to hear the least noise. Wait until to-morrow night ; she will be gone then. But indeed John, I don't like this business at all. I think we'd better give it up. No luck will come of it, I am sure.'

'Look here, Martha,' said the man. 'I have a chance of getting safe off now. I have it all settled, if you will only help me to get this old woman's plate. With that and a few little trinkets I happened to pick up a few years ago, you and I may set up in business over in America. The other fellows will help me. Meet me here to-morrow night, to let me know that all is safe for us. See here. I have brought you a valuable present. Keep it until the plate is secure with me ; for you must stay here until all blows over ; then make some excuse for leaving, and come over and join me in New York. If you want money, sell these diamonds in Liverpool ; they are worth no end of money.'

I could see quite well that he took something out of his pocket and gave it to her. She held it up to look at it ; and there, glistening in bright moonlight, I saw—my god-mother's diamond ear-ring ! the one that had been stolen over nine years ago with the other jewels from her room.

Here then at last was the mystery solved, everything made clear, and all through my dream ! Presently the light fell on the man's face again, and I instantly recognised my god-mother's very respectable gardener. A decent man he was believed to be, but a thief all the time, and one who hid his evil deeds under a cloak of religion. And who was this woman he seemed to have got such power over ? Evidently his wife ; for I gathered that from his conversation with her. I waited where I was until they were both gone—Martha back to the house, and her husband to the village ; then as quietly as I could I returned to the house and reached my room. Falling on my knees I gave thanks to God for making me the means of finding out such a wicked plot, and perhaps saving the lives of more than one under that roof ; for it is more than likely that had those desperate men been disturbed in their midnight plunder, they would not have hesitated at any deed which would enable them to carry out their wicked plans.

I slept little that night, and next morning tried to appear calm and composed, though I was frightened and really ill. I was longing for my husband to come, that I might tell him all, and consult what was best to be done, to prevent robbery and perhaps bloodshed. At last, to my great relief, I saw him coming. I ran to the gate to meet him, and told him what I had seen and

heard 'the night before. 'Now,' I said, 'will you ever laugh at my "fancies" again?'

'No, my dear little wife,' said he; 'I never will.'

We then arranged that we should tell his mother and sister everything; and he was to go to the nearest police station and arrange with the chief officer to have a number of men ready in the wood near the house at twelve o'clock that night; that after dinner we were to say 'good-bye' to Mrs Benson, and drive home; but would return and join the police in the wood, and wait there until we saw Martha leave the house to meet her husband. We were then to go in and wait until the thieves came in, when they were to be surrounded and taken prisoners. My husband wanted me to remain at our own house; but I would not do so, as I said I would only be imagining all sorts of dreadful things; besides, I knew his mother and Mary would like to have me with them.

It all turned out as well as could be. The night was very fine; and just at twelve o'clock Martha stole down to the place where I had seen her the night before; then we all, about a dozen policemen and ourselves, went into the house. The men were stationed out of sight in different rooms, waiting for the robbers' entrance. Henry came up to Mrs Benson's room, where all of us women were, including the two servants. With breathless anxiety we watched and waited. From where I stood I could see the way they would come.

It was about two o'clock when I saw Martha coming up the walk and four men with her. 'Look!' I said; 'there they are.' They went round to the back door, and we heard them stealing along the passage in the direction of the plate-closet. Then a sudden rush—a scream from the wretched Martha—imprecations loud and bitter—a shot!—another scream!

'May God grant no lives will be lost!' we prayed.

Poor Mary nearly fainted. At last we heard the officer call Henry to come down. The four men were well secured and taken to the police station. Martha was taken there too. She confessed she had let them in for the purpose of stealing the silver. One of the robbers was slightly wounded in the arm, but no one else was hurt. Very thankful was I when I found next day that none was the worse for having gone through such a terrible scene.

The house where Martha's husband lodged was searched, and the case of diamonds and many other valuable articles found there. This immensely respectable gardener had been a disgrace to his family and his profession. Left very much to himself through the indulgence of his employer, he had contracted habits of tipping with low associates at the neighbouring village, and become so completely demoralised, as at length to assume the degraded character of a burglar. Now came the retribution which attends on wrong-doing. The thieves were all tried at the next assizes, and sentenced to various terms of imprisonment.

It is now many years since all this happened; but I can never forget what I went through those two dreadful nights; though I remember with thankfulness, that through my dream and the warning voice I heard, I was the means of averting a great wrong, and perhaps murder. I do not

impute anything supernatural to my dream. It may have merely been the result of tension of feelings, supported by some coincidences. At all events, the results were such as I have described.

ODD NOTES FROM QUEENSLAND.

QUEENSLAND, as is pretty generally known, is the latest planted British colony in Australia, and has already made a surprising degree of progress. Situated on the coast of the Pacific, to the north of New South Wales, its more settled parts enjoy a delightful climate, which is said to resemble that of Madeira. It is usually thought that nowhere in the world do new and small towns develop so speedily into populous cities as in the United States; but in this respect Queensland can shew results nearly as remarkable. In Brisbane, the capital of the colony, one finds immense enterprise, with all the tokens of civilisation on the English model. A correspondent favours us with the following notes suggested by the *Queenslander*, which we presume to be the leading newspaper in the colony.

A cursory glance down the advertising columns of the *Queenslander* gives one no mean notion of the colony's capacities. One auctioneer announces for sale three thousand square miles of land, twenty-one thousand head of cattle, and a hundred and twenty-four thousand sheep. A dairy herd of six hundred head is in the market here, and there a stock-owner announces he has seven hundred pure merino rams to dispose of. Sugar-plantations, salt-works, gold mines, are on offer; and—incontrovertible proof of the land's capabilities—nurserymen are ready to supply all comers with seeds or roots 'of all the favourite flowers known in England,' of every kind of grass and grain and vegetable familiar to the British farmer and market-gardener; and keep in stock thoroughly acclimatised apples, pears, plums, cherries, peaches, apricots, nectarines, quinces, mulberries, walnuts, chestnuts, coconuts, grapes, figs, limes, lemons, oranges, dates, guavas, and mangoes, in every approved variety.

One correspondent extols the merits of chicory as a profitable thing to grow; another relates his successful attempts at rice-raising; and a third waxes eloquent anent the unique garden of Mr Barnes of Mackay, with its groves and avenues of cocoa-nut trees; its hundreds of fine date-trees: its grapes, oranges, apples, and fruits of all climes and seasons, thriving together; its enormous melons and magnificent pines ripening and rotting around. The owner looks forward to reaping a large profit from his twelve hundred cocoa-nut trees, many of them now thirty feet high, although as yet the return for his ten years' labour and expenditure has been something not worth mentioning.

Then we have an account of 'the acclimated wonders of the vegetable kingdom blooming in this present February 1877, in the government Botanic Gardens of Brisbane;' said gardens being

then in the height of their midsummer glory, and a perfect blaze of colour. 'One of the most strikingly handsome as well as curious trees in the gardens is the *Kilgeria pinnata*, from India. Its branches bear a kind of drooping flexible vine-rope or liana stem, each of which terminates in a large spike of flowers; while at various parts of the said rope pendants, hang huge seed-pods, like in shape unto the weights of an extra large cuckoo-clock.' Several varieties of the mango just now are in fine bearing, and the wine-palm of the West African coast was never more juicy and strawberry-like in flavour. Ferns and palms are magnificent, but after all, the Queenslander finds a native plant excite his admiration most. 'No description can do justice to the exquisite colour of the so-called blue water-lily of this colony. It is *not* blue, nor white, nor mauve, nor lilac, but has a blended dash of all of them, and is lovelier than any. A Swiss or French dyer who could reproduce it faithfully would make his fortune. It is a colour suggestive of summer afternoons, of lawns, of croquet, of classic villas, swell society, and five o'clock teas in the garden, with greyhounds, spaniels, pretty girls, and rosy children grouped about miscellaneous like.'

Acclimatisation has succeeded too thoroughly in one instance—the rabbit, as we have had occasion to shew in a previous paper, having increased and multiplied until the colonists have reason to wish he had never been induced to settle in the land. One wheat-grower, wroth at having to sit up o' nights with his farm hands, dogs, bullock-bells, and tin cans, in order to scare the little pests to their burrows, lest, like his neighbours, he should have nothing left to reap, declares either the rabbit or the farmer must go down; there is no longer room for both. Sheep-farmers are in a similar predicament; but their trouble is of native growth; the kangaroo is their *bête noire*, and they are busy arming against the pouched depredators. Kangaroo battues are the rage. At one held at Warroo, upwards of three thousand five hundred of these animals were disposed of in ten days; making eight thousand of which the run had been cleared in the space of a month—equivalent to saving pasturage for a like number of sheep. Another sheep-owner, after shooting down four thousand kangaroos on a small portion of his run, finds it necessary to call in outside aid, and lay in tons of cartridges for the use of those who respond to the appeal. By report just to hand (Oct. 1877) we find that the process of kangaroo extermination is still at work.

There are other nuisances it would be well to see to. A woodman at Maryborough lately died of a scorpion sting; and we read of a man being bitten by a black snake while working a short distance from Brisbane. His mates scarified the wound, bound up the arm, and administered a large dose of brandy; put the patient into a cart, and made for a dispensary with all possible speed. Here the wound was scarified again; and a doctor

passing by, being called in, cauterised it, and injected ammonia. In a few minutes the man's spasmodic struggles ceased, and he was able to walk to a cab. By the time he reached the hospital all traces of the venom had disappeared, and he seemed only to suffer from the effects of the spirits he had imbibed. The ammonia treatment of snake-bite is not efficacious with the lower animals; at least in a series of experiments upon dogs, not a single canine sufferer recovered. Although Queensland is reputed to be a land of rivers and streams, there are tracts where water is scarce, and those who recklessly go on the tramp, or 'wallaby,' as this kind of vagabondising is called, sometimes experience the horrors of thirst, and actually sink down and die in the wilderness.

To prove the truth of this, and to shew that examples are not wanting of travellers who have died of thirst, a correspondent of the *Queenslander* tells how, following the tracks of some horses that had strayed from their beat, he came upon a pair of moleskin trousers hanging upon a tree, as if put there for a signal of distress. Looking about, he picked up a torn pocket, containing an illegible cheque and a match-box; and scattered about on the grass saw a blanket, shirt, hat, and water-bag. Searching further, he found the skull and bones of a man who had apparently been dead some two or three weeks; some of the flesh was still on the bones, and the brains were almost intact. Bags of flour, tea, and sugar lay near; a proof that the poor fellow had not died of hunger, but of thirst, the nearest water being twelve miles from the spot where he died his lonely death.

Thomas Stevenson, a lad of seventeen, started one December morning from his brother's station, some fifty miles from Louth, New South Wales, for the post-office at that place, which he reached safely, and left again at daybreak on the Saturday. The following Wednesday his horse arrived home, bearing his rider's coat, scarf, and spurs. His brother started for the bush with some black trackers, who found that the missing lad had been wandering on the Debil-Debil Mountains, but finding it impossible to get his horse down them, had turned back to get round the base of the mountains, but mistaking the road and overtaken by darkness, had camped out and hobbled his horse. After a three days' search the trackers discovered the body of young Stevenson lying between two logs in a lonely part of the bush. The weather had been extremely hot, and it was known he had no water-bag with him; so there was little doubt that he died of thirst. After losing his way and losing hope, he must have taken off his coat, scarf, and spurs, fastened them to a saddle, and turned the horse loose. Then placing the two logs on a track, he had lain down between them with his head resting on a cross-piece at one end, and so waited Death's releasing hand.

If advertising means business, business should be brisk indeed at Darling Downs, since the editor of the *Darling Downs Gazette* finds it necessary to explain the absence of the customary 'leader' in this wise: 'Owing to a press of advertis— In fact it is coming to this, that we shall have to throw up the business if people come hustling their advertisements in at the rate they are doing. The general appreciation of the fact that the *Gazette*

is bound to be read by everybody, is becoming overwhelming. We plead guilty to no leader this time; but what were we to do? Only just now a bald-headed man came rushing in—But stop! let us first explain that we mean no offence to bald-headed men, and they needn't get up in arms. Goodness knows, we were bald-headed enough ourselves once upon a time, and used to be up in arms frequently about that period. Ask our nurse. However, as we were about to say, a bald-headed man came hustling in just as we had commenced our leader, and had got as far as, "When the history of mankind shall have been disinterred from the triturated and inevaporable sediments of its consummated cosmogony"—and while with our pen suspended we were working up the continuation in the same gay and sparkling style, that bald-headed man violently brought us down from the ethereal heights in which we were soaring, and wanted to know whether we could spare space for a column or so of advertisements. He fluttered some dingy papers, each marked five pounds, under our eyes, and we rather liked it. But we conquered our feelings and remarked: "Caitiff! our duty to our readers demands a leading article; hang advertisements! Take your beak from out our heart; take your form from off our door." The wretch winked, and went to the book-keeper, and inveigled him into finding space for that advertisement. Since then, there have been processions of bald and hairy men with insidious manners and fluttering notes, palming off advertisements on us. In short—or if the reader objects to that phrase as inappropriate—at length, we have no leading article, and if the reader could only witness our tears!

With certain parliamentary proceedings fresh in remembrance, we dare not cast stones at our cousins for not eliminating the rowdy element from their legislatures. That it should be predominant is not surprising, since we are assured, that in view of a coming dissolution, candidates swarm on the ground like frogs in a marsh. Every man who has figured in the insolvent list for the last three years; every boot-black whose stock of materials has given out; wild wood-carters whose only horse and hope is dead; country newspaper reporters down on their luck; country-town bellmen whose vocation has been supplanted; seedy men who cry penny papers in the streets: in short, all Bohemia and its dependencies have taken the field with a view to winning senatorial honours and the three hundred a year going with them. Prominent among these candidates stand Tom McInerney, who bases his claims upon the fact that he owns fifteen drays and fourteen children, and is under the impression that S. L. after a man's name denote him to be a civil engineer; and Patrick Tyrrell, who objects to 'circular' education, and who proved himself a real Irishman when asked if he would tax absentees, by replying: 'To be sure I would, if they didn't live in the country.'

However Australian legislators may indulge in libellous personalities, it is pleasant to note that such things are not received into favour by the press; the *Queenslander* notifying to all concerned, that 'any statement, comment, or criticism of a personal character calculated to provoke ill-feeling in the community from which it may be penned, will not only be rigorously excluded, as hitherto,

but any correspondent who may think fit to forward such matter for publication will be immediately requested to discontinue his connection with this journal.' To be perfect, this notification only needs the N.B.—English papers please copy.

TAKING IT COOLLY.

SOME of many instances of extraordinary coolness in the midst of danger and otherwise that have been recorded, are here offered to our readers, together with some amusing sayings and doings. When gallant Ponsonby lay grievously wounded on the field of Waterloo, he forgot his own desperate plight while watching an encounter between a couple of French lancers and one of his own men, cut off from his troop. As the Frenchmen came down upon Murphy, he, using his sword as if it were a shillelagh, knocked their lances alternately aside again and again. Then suddenly setting spurs to his horse, he galloped off full speed, his eager eyes following in hot pursuit, but not quite neck and neck. Wheeling round at exactly the right moment, the Irishman, rushing at the foremost fellow, parried his lance, and struck him down. The second, pressing on to avenge his comrade, was cut through diagonally by Murphy's sword, falling to the earth without a cry or a groan; while the victor, scarcely glancing at his handiwork, trotted off whistling *The Grinder*.

Ponsonby's brave cavalry-man knew how to take things coolly, which, according to Colonel R. P. Anderson, is the special virtue of the British man-of-war, who, having the utmost reliance in himself and his commanders, is neither easily over-excited nor readily alarmed. In support of his assertion, the colonel relates how two tars, strolling up from the Dil-Kusha Park, where Lord Clyde's army was stationed, towards the Residency position at Lucknow, directed their steps by the pickets of horse and foot. Suddenly, a twenty-four-pound shot struck the road just in front of them. 'I'm blessed, Bill,' said one of the tars, 'if this here channel is properly buoyed!' and on the happy-go-lucky pair went towards the Residency, as calmly as if they had been on Portsmouth Hard. During the same siege, a very young private of the 102d was on sentry, when an eight-inch shell, fired from a gun a hundred yards off, burst close to him, making a deal of noise and throwing up an immense quantity of earth. Colonel Anderson rushed to the spot. The youthful soldier was standing quietly at his post, close to where the shell had just exploded. Being asked what had happened, he replied unconcernedly: 'I think a shell has busted, sir.'

Towards the close of the fight of Inkermann, Lord Raglan, returning from taking leave of General Strangways, met a sergeant carrying water for the wounded. The sergeant drew himself up to salute, when a round-shot came bounding over the hill, and knocked his forage-cap out of his hand. The man picked it up, dusted it on

his knee, placed it carefully on his head, and made the salute, not a muscle of his countenance moving the while: 'A neat thing that, my man?' said Lord Raglan. 'Yes, my lord,' returned the sergeant, with another salute; 'but a miss is as good as a mile.' The commander was probably not surprised by such an exhibition of *sang-froid*, being himself good that way. He was badly hurt at Waterloo; and, says the Prince of Orange, who was in the hospital, 'I was not conscious of the presence of Lord Fitzroy Somerset until I heard him call out in his ordinary tone: "Hollo! Don't carry that arm away till I have taken off my ring!" Neither wound nor operation had extorted a groan from his lips.'

The Indian prides himself upon taking good or ill in the quietest of ways; and from a tale told in Mr Marshall's *Canadian Dominion*, his civilised half-brother would seem to be equally unemotional. Thank mainly to a certain Métis or half-breed in the service of the Hudson Bay Company, a Sioux warrior was found guilty of stealing a horse, and condemned to pay the animal's value by instalments, at one of the Company's forts. On paying the last instalment, he received his quittance from the man who had brought him to justice, and left the office. A few moments later the Sioux returned, advanced on his noiseless moccasins within a pace of the writing-table, and levelled his musket full at the half-breed's head. Just as the trigger was pulled, the Métis raised the hand with which he was writing and touched lightly the muzzle of the gun; the shot passed over his head, but his hair was singed off in a broad mass. The smoke clearing away, the Indian was amazed to see his enemy still lived. The other looked him full in the eyes for an instant, and quietly resumed his writing. The Indian silently departed unpursued; those who would have given chase being stopped by the half-breed with: 'Go back to your dinner, and leave the affair to me.'

When evening came, a few whites, curious to see how the matter would end, accompanied the Métis to the Sioux encampment. At a certain distance he bade them wait, and advanced alone to the Indian tents. Before one of these sat crouched the baffled savage, singing his own death-hymn to the tom-tom. He complained that he must now say good-bye to wife and child, to the sunlight, to his gun and the chase. He told his friends in the spirit-land to expect him that night, when he would bring them all the news of their tribe. He swung his body backwards and forwards as he chanted his strange song, but never once looked up—not even when his foe spurned him with his foot. He only sang on, and awaited his fate. Then the half-breed bent his head and spat down on the crouching Sioux, and turned leisurely away—a crueller revenge than if he had shot him dead.

It is not given to every one to play the philosopher, and accept fortune's buffets and favours with equal placidity. Horatios are scarce. But there

are plenty of people capable of behaving like Spartans where the trouble does not touch their individuality. 'How can I get out of this?' asked an Englishman, up to his armpits in a Scotch bog, of a passer-by. 'I dinna think ye can get oot of it,' was the response of the Highlander as he went on his way.

Mistress of herself was the spouse of the old gentleman, who contrived to tumble off the ferry-bont into the Mississippi, and was encouraged to struggle for dear life by his better-half shouting: 'There, Samuel; didn't I tell you so? Now then, work your legs, flap your arms, hold your breath, and repeat the Lord's Prayer—for its mighty onsartin, Samuel, whether you land in Vicksburg or eternity!'

Thoroughly oblivious of court manners was the red-cloaked old Kentish dame who found her way into the tent occupied by Queen Charlotte, at a Volunteer review held shortly after her coming to England, and after staring at the royal lady with her arms akimbo, observed: 'Well, she's not so ugly as they told me she was!'—a compliment the astonished queen gratefully accepted, saying: 'Well, my good woman, I am very glad of dat.' Probably Her Majesty forgave her critic's rudeness as the outcome of rustic ignorance and simplicity.

There is no cooler man than your simple fellow. While General Thomas was inspecting the fortifications of Chattanooga with General Garfield, they heard some one shout: 'Hello, mister! You! I want to speak to you!' General Thomas, turning, found he was the 'mister' so politely hailed by an East Tennessean soldier.

'Well, my man,' said he, 'what do you want with me?'

'I want to get a furlough, mister, that's what I want,' was the reply.

'Why do you want a furlough, my man?' inquired the general.

'Wall, I want to go home and see my wife.'

'How long is it since you saw her?'

'Ever since I enlisted; nigh on to three months.'

'Three months!' exclaimed the commander.

'Why, my good fellow, I have not seen my wife for three years!'

The Tennessean looked incredulous, and drawled out: 'Wall, you see, me and my wife ain't that sort!'

The Postmaster-general of the United States once received an odd official communication; the Raeborn postmaster, new to his duties, writing to his superior officer: 'Seeing by the regulations that I am required to send you a letter of advice, I must plead in excuse that I have been postmaster but a short time; but I will say, if your office pays no better than mine, I advise you to give it up.' To this day, that Postmaster-general has not decided whether his subordinate was an ignoramus or was quietly poking fun at him.

Spite of the old axiom about self-praise, many are of opinion that the world is apt to take a man at his own valuation. If that be true, there is a church dignitary in embryo somewhere in the young deacon, whose examining bishop felt it requisite to send for the clergyman recommending him for ordination, in order to tell him to keep that young man in check; adding by way of

explanation: 'I had the greatest difficulty, sir, to prevent him examining me!' This not to be abashed candidate for clerical honours promises to be as worthy of the cloth as the American minister who treated his village congregation to one of Mr Beecher's sermons, unaware that the popular Brooklyn preacher made one of his hearers. Accosting him after service, Mr Beecher said: 'That was a fair discourse; how long did it take you to write it?'

'Oh, I tossed it off one evening,' was the reply.

'Indeed!' said Mr Beecher. 'Well, it took me much longer than that to think out the framework of that sermon.'

'Are you Henry Ward Beecher?' asked the sermon-stealer.

'I am,' said that gentleman.

'Well, then,' said the other, not in the least disconcerted, 'all I have to say is, that I ain't ashamed to preach one of your sermons anywhere.'

We do not know if Colman invented the phrase, 'As cool as a cucumber;' but he makes the Irishman in *The Heir-at-Law* say: 'These two must be a rich nian that won't lend, and a borrower; for one is trotting about in great distress, and t' other stands cool as a cucumber.' Of the two, the latter was more likely to have been intending a raid on another man's purse, for the men whose 'very trade is borrowing' are usually, we might say necessarily, the coolest of the cool; like Bubb Dodington's impecunious acquaintance, who, rushing across Bond Street, greeted Dodington with: 'I'm delighted to see you, for I am wonderfully in want of a guinea.'

Taking out his purse, Bubb shewed that it held but half a guinea.

'A thousand thanks!' cried his tormentor, deftly seizing the coin; 'that will do very well for the present;' and then changed the conversation. But as he turned to take leave, he inquired: 'By-the-by, when will you pay me that half-guinea?'

'Pay you? What do you mean?' exclaimed Dodington.

'Mean? Why, I intended to borrow a guinea of you. I have only got half; but I'm not in a hurry for t' other. Name your own time, only pray keep it!' saying which, he disappeared round the corner.

'John Phoenix' the American humorist being one night at a theatre, fancied he saw a friend some three seats in front of him. Turning to his next neighbour he said: 'Would you be kind enough to touch that gentleman with your stick?' 'Certainly,' was the reply, and the thing was done; but when the individual thus assaulted turned round, Phoenix saw he was not the man he took him for, and became at once absorbed in the play, leaving his friend with the stick to settle matters with the gentleman in front, which, as he had no excuse handy, was not done without considerable trouble. When the hubbub was over, the victim said: 'Didn't you tell me to tap that man with my stick?' 'Yes.' 'And what did you want?' 'Oh,' said Phoenix, with imperturbable gravity, 'I wanted to see whether you *would* tap him or not!'

'Jack Holmes,' a man-about-town, living no one knew how, was once under cross-examination by a certain sergeant-at-law, who knew his man too well. 'Now, sir,' said the learned gentleman, 'tell the jury how you live?'

'Well,' said Holmes, 'a chop or a steak, and on Sunday perhaps a little bit of fish; I am a very plain-living man.'

'You know what I mean, sir,' thundered the questioner. 'What do you do for a living?'

'The same as you, sergeant,' said the witness, tapping his forehead suggestively; 'and when that fails, I do'—going through the pantomime of writing across his hand—'a little bit of stuff—the same as you again.'

'My lud, I shall not ask this obtuse witness any more questions,' said the angry counsel.

'Brother,' said Baron Martin, 'I think you had better not.'

Here is a hint for our old friend the clown in the pantomime. At the burning of a provision store, the crowd helped themselves freely. One man grasped a huge cheese as his share of the salvage; rising up with it he found himself face to face with a policeman, and with admirable presence of mind put the plunder into the officer's arms, saying: 'You had better take care of that, policeman, or some one will be walking off with it.'

Equally ready to relinquish his loot when there was no help for it was a Chicago negro, caught by a poultry fancier in the act of carrying off some of his live stock, and challenged with: 'What are you doing with my chickens?' 'I wuz gwine fer ter fetch 'em back, boss,' explained he. 'Dere's a nigger roun' here what's bin disputin along er me 'bout dem chickens. I said dey wuz Coachin Chyniz; an he said dey wuz Alabamar pullets; an I wuz jes takin 'em roun' fer ter establish my nollidge. Dey don't lay no aigs, does dey, boss? Ef dey does, I'm mighty shamed of hustlin 'em roun'. Aigs is scarce.'

Impudently cool as the darkey was, he must yield the palm for effrontery to the Erie Railway guard, whose interview with Manager Fisk is thus related in an American paper.

'You are a conductor on the Erie, I believe?'

'Yes, sir.'

'How long have you been on the road?'

'Fifteen years.'

'Worth some property, I learn?'

'Some.'

'Have a very fine house in Oswego? Cost you some thirty, forty, or fifty thousand dollars?'

'Yes, sir.'

'Some little money invested in bonds, I am told?'

'Yes, sir.'

'Own a farm near where you reside?'

'Yes, sir.'

'Had nothing when you commenced as conductor on our road?'

'Nothing to speak of.'

'Made the property since?'

'Yes, sir.'

'Been at work for no other parties?'

'No; but I have been saving money, and invested it from time to time to good advantage.'

'Well, sir, what will you give to settle? Of course you cannot pretend to say you have acquired this property from what you have saved from your salary? You will not deny that you have pocketed a great deal of money belonging to the railway—at least fifty or sixty thousand dollars? Now, sir, what will you give to settle, and not be disgraced, as you certainly will be if a trial is brought, and

you are compelled to give up the property you profess to own, but which in reality belongs to the Company ?'

'Well, Mr Manager, I had not thought of the matter. For several years I have been running my train to the best of my ability. Never looked at the matter in this light before. Never thought I was doing anything wrong. I have done nothing more than other conductors; tried to earn my salary and get it, and think I've succeeded. I don't know that I owe the Company anything. If you think I do, why, there's a little difference of opinion, and I don't want any trouble over it. I have a nice family, nice father and mother; relatives all of good standing; they would feel bad to have me arrested and charged with dishonesty. It would kill my wife. She has every confidence in me, and the idea that I would take a penny that did not belong to me would break her heart. I don't care anything for the matter myself; but on account of my family and relatives, if you won't say anything more about it, I'll give you say—a dollar !'

THE MONTH: SCIENCE AND ARTS.

MR CHARLES BARRY, President of the Royal Institute of British Architects, in his opening address, mentioned that with a view to facilitate the studies of young men, the library of the Institute is open from ten in the morning till nine at night, to members of the Architectural Association, to the architectural classes of the Royal Academy, of University College, and King's College. A fee of five shillings a year and a proper recommendation are the conditions on which this valuable privilege may be obtained; and it is to be hoped that earnest-minded students—the architects of the future—will hasten to avail themselves of this generously offered store of knowledge.

The Council of the Institute have given notice of lectures which are to be delivered at University College, London, during the present session, comprising Ancient Architecture as a Fine Art; on Construction and Materials; on Roofing, Masonry, Quarries, Arches, and Groining. At King's College also there will be lectures on the Mechanics of Construction; on Constructive Design and Practice, besides classes for the study of Architectural Drawing, Descriptive Geometry, and Surveying and Levelling. Young men who wish to study architecture and allied subjects have in the courses thus provided for, a favourable opportunity. Among the papers announced for reading at the meetings of the Institute are: On the Architecture of Norway; On the Prevention of Corrosion in Iron; and Syria, the Cradle of Gothic Architecture; which may be expected to present especial points of interest.

The Council of the Royal Agricultural Society have published a statement of members' privileges which is worth attention. On payment of a moderate fee the advice of a competent veterinary inspector can be had in cases of disease among the live-stock; post-mortem examinations can be made, and the animals may be sent to the Brown Institution, Wandsworth Road, London, where the Professor-Superintendent undertakes 'to carry out such investigations relating to the nature, treatment, and prevention of diseases of cattle, sheep,

and pigs, as may be deemed expedient by the Council of the Society.' Reports on the cases are drawn up quarterly, or specially as may be required. Analyses of guano and other fertilisers, of soils, of water, of vegetable products, may be had; also reports on seeds, with determination of the quantity of weeds mingled among them; on vegetable parasites; on diseases of farm-crops. And besides all this, any member whose lands are infested by noxious intruders may have a 'determination of the species of any insect, worm, or other animal, which, in any stage of its life, injuriously affects the farm-crops, with a report on its habits, and suggestions as to its extermination.'

Experiments on the fattening of animals by Messrs Lawes and Gilbert help to settle the much-debated question as to whether fat is produced exclusively from nitrogenous food or not. Their conclusion is, that excess of nitrogen contributes to growth but not to fatness. 'There is, of course,' they say, 'a point below which the proportion of nitrogenous substance in the food should not be reduced; but if this be much exceeded, the proportion of the increase, and especially of the fat-increase, to the nitrogenous substance consumed, rapidly decreases; and it may be stated generally, that taking our current fattening food-stuffs as they are, it is their supply of digestible non-nitrogenous, rather than of nitrogenous constituents which guides the amount, both of the food consumed and of the increase produced, by the fattening animal.'

Since the outbreak of discussion on spontaneous generation and the germ theory, many readers have become familiar with the term Bacteria, by which certain minute organisms are described. The question involved may be studied from different points of view, as appears from a communication addressed to the Royal Society by Dr Downes and Mr Blunt, a chemist, on the Effect of Light upon Bacteria and other Organisms. Properly prepared solutions were inclosed in glass tubes; some of the tubes were placed in sunlight, others were covered with paper or some material that excluded light. The dark tubes became turbid; the light tubes remained clear. The experiments modified in various ways were continued from April to October; and the conclusions that the experimentalists came to were that—Light is inimical to the development of Bacteria and the microscopic fungi associated with putrefaction and decay, its action on the latter being apparently less rapid than upon the former—That the preservative quality of light is most powerful in the direct solar ray, but can be demonstrated to exist in ordinary diffused daylight—and That this preservative quality appears to be associated with the actinic rays of the spectrum. 'It appears to us,' say the two gentlemen, 'that the organisms which have been the subject of our research may be regarded simply as isolated cells, or minute protoplasmic masses specially fitted by their transparency and tenuity for the demonstration of physical influences. May we not expect that laws similar to those which here manifest themselves may be in operation throughout the vegetable, and perhaps also the animal kingdom wherever light has direct access to protoplasm? On the one hand, we have chlorophyll (colouring substance of leaves, &c.) owing its very existence to light, and whose functions are deoxidising; on the other, the

white 'protoplasm or germinal matter oxidising in its relations, and to which, in some of its forms at least, the solar rays are not only non-essential, but even devitalising and injurious.

'This suggestion,' continued the gentlemen, 'we advance provisionally and with diffidence; nor do we wish to imply that the relations of light to protoplasmic matter are by any means so simple as might be inferred from the above broad statement.'

A paper by Dr Burdon Sanderson, F.R.S., read before the same Society, contains, amid much that is controversial about *Bacteria*, germs, organised particles, development and so forth, a few passages which all intelligent readers will be able to understand. On the question of disease-germs, the learned doctor remarks: 'In order that any particle may be rightly termed a disease-germ, two things must be proved concerning it: first, that it is a living organism; secondly, that if it finds its way into the body of a healthy human being or of an animal, it will produce the disease of which it is the germ. Now there is only one disease affecting the higher animals in respect of which anything of this kind has been proved, and that is splenic fever of cattle. In other words, there is but one case in which the existence of a disease-germ has been established. Comparing such a germ with the germinal particles we have been discussing, we see that there is but little analogy between them, for, first, the latter are not known to be organised; secondly, they have no power of producing disease, for it has been found by experiment that ordinary *Bacteria* may be introduced into the circulating blood of healthy animals in considerable quantities without producing any disturbance of health. So long as we ourselves are healthy, we have no reason to apprehend any danger from the morbid action of atmospheric dust, except in so far as it can be shewn to have derived infectiveness from some particular source of miasma or contagium.'

In a communication to the *American Journal*, Professor Kirkwood discusses the question—Does the motion of the inner satellite of Mars disprove the nebular hypothesis? This satellite he remarks is within three thousand four hundred miles of the planet's surface, and completes three orbital revolutions in less than a Martian day. How is this remarkable fact to be reconciled with the cosmogony of Laplace? The Professor then remarks that there is some similarity between the movements of the satellites and those of the rings of Saturn. The rings are composed of clouds of exceedingly minute planetoids, and while the outer ring revolves in a period somewhat greater than that of Saturn itself, 'the inner visible edge of the dusky ring completes a revolution in about eight hours. These rings, in the words of Professor Tait, 'like everything cosmical, must be gradually decaying, because in the course of their motion round the planet there must be continual impacts among the separate portions of the mass; and of two which impinge, one may be accelerated, but at the expense of the other. The other falls out of the race, as it were, and is gradually drawn in towards the planet. The consequence is that, possibly not so much on account of the improvement of telescopes of late years, but perhaps simply in consequence of this gradual closing in of the whole system, a new ring of Saturn has been observed inside the

two old ones, called from its appearance the crape ring, which was narrow when first observed, but is gradually becoming broader. That crape ring is formed of the laggards which have been thrown out of the race, and are gradually falling in towards Saturn's surface.' It is then suggested that, by a process similar to that here described, the phenomena of the Martian system may have been produced, and the argument concludes thus: 'Unless some such explanation as this can be given, the short period of the inner satellite will doubtless be regarded as a conclusive argument against the nebular hypothesis.'

In a paper read at a meeting of the Royal Astronomical Society, Mr Brett argues against the hypothesis that Mars is in a condition similar to that of the earth. He grounds his conclusion on the fact that in all his observations of Mars he has seen no clouds in the atmosphere thereof. That atmosphere is very dense, of great bulk, and is probably of a temperature so high that any aqueous vapour contained therein is prevented from condensation. Mr Brett implies that the glowing red colour of the middle of the disk is glowing red heat; and he remarks, in terrestrial experience there is always an intermediate phenomenon between vapour and snow, namely opaque cloud; and the absence of this condition seems fatal to the hypothesis that the white polar patch, as hitherto supposed, consists of snow. According to Mr Brett this patch is not only not snow; constitutes no part of the solid mass of the planet; but is nothing more than a patch of cloud, 'the only real cloud existing in Mars.'

From particulars published in the *Quarterly Journal* of the Geological Society, it appears that metallic copper and copper ore have been discovered along a tract of country in Nova Scotia, that the specimens when analysed at Swansea yielded satisfactory results, and that 'Nova Scotia may soon appear on the list of copper-producing countries, it being confidently expected that during the approaching summer fresh localities will be proved to contain copper-bearing veins.' And shifting the scene, we learn from the same *Journal* that in the South African Diamond Fields, two claims in Kimberley Mine, comprising eighteen hundred square feet, have yielded twenty-eight thousand carats of diamond; that at Lydenburg, in the Transvaal country, most of the alluvial gold is supplied by Pilgrim's Rest Creek, the gold being coarse and nuggety, in well-rounded lumps, some of which, ten pounds in weight, are worth from seventy-six to eighty shillings an ounce; and that near the Oliphant River cobalt ore is found, of which a hundred tons have been sent to England. The same locality yields beryls, and is believed to be rich in other minerals.

Compressed air on being released from pressure can be cooled down to a very low temperature by throwing into it a jet of cold water. Advantage has been taken of this fact in contriving a new refrigerator or freezing chamber; and we are informed that at a trial which took place with a view to commercial purposes, 'in half an hour after commencing to work the machine, the thermometer within the freezing chamber stood at twenty degrees below zero; the interior of the chamber was covered with hoar-frost half an inch thick, bottles of water were frozen solid, and the general temperature of the room in which the
